DNS Root Name Service Protocol and Deployment Requirements

Abstract

The DNS root name service is a critical part of the Internet architecture. The protocol and deployment requirements for the DNS root name service are defined in this document. Operational requirements are out of scope.

Status of This Memo

This memo documents an Internet Best Current Practice.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on BCPs is available in Section 2 of RFC 5741.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at http://www.rfc-editor.org/info/rfc7720.

1.  Introduction

[RFC2870] discusses protocol and operational requirements for root name servers for the Internet’s domain name system (DNS) protocol [RFC1035]. Since its publication, both protocol and operational requirements have evolved. It makes more sense now to separate the two sets of requirements into two separate documents. This document only defines the protocol requirements and some deployment requirements. The operational requirements that were defined in RFC 2870 have been removed. Operational requirements are now defined by the Root Server System Advisory Committee of ICANN and are documented in [RSSAC-001].

The root servers are authoritative servers of the unique [RFC2826] root zone (".") [ROOTZONE]. They currently also serve the root-servers.net zone. Some also serve the zone for the .arpa top-level domain [ARPAZONE] [RFC3172]. This document describes the external interface of the root name servers from a protocol viewpoint of the service. It specifies basic requirements for the Internet that DNS clients meet when interacting with a root name service over the public Internet.

The keywords MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, SHOULD NOT, RECOMMENDED, MAY, and OPTIONAL, when they appear in this document, are to be interpreted as described in BCP 14, [RFC2119].

1.1.  Relationship to RFC 2870

This document obsoletes [RFC2870].

This document and [RSSAC-001] together functionally replace [RFC2870].
2. Protocol Requirements

This section describes the minimum high-level protocol requirements. Operative details are documented in [RSSAC-001].

The root name service:

- **MUST** implement core DNS [RFC1035] and clarifications to the DNS [RFC2181].
- **MUST** support UDP [RFC768] and TCP [RFC793] transport of DNS queries and responses.
- **MUST** generate checksums when sending UDP datagrams and **MUST** verify checksums when receiving UDP datagrams containing a non-zero checksum.
- **MUST** implement DNSSEC [RFC4035] as an authoritative name service.
- **MUST** implement extension mechanisms for DNS (EDNS(0)) [RFC6891].

3. Deployment Requirements

The root name service:

- **MUST** answer queries from any entity conforming to [RFC1122] with a valid IP address.
- **MUST** serve the unique [RFC2826] root zone [ROOTZONE].

4. Security Considerations

This document does not specify a new protocol. However, the root name service is a key component of the Internet architecture and play a key role into the overall security of the Internet [RFC2826]. Specific security considerations on the DNS protocols are discussed in their respective specifications. The security considerations on the operational side of the root name servers are discussed in [RSSAC-001].
5. Informative References

Acknowledgements

Some text was taken from [RFC2870]. The editors of this document would like to sincerely thank the following individuals for valuable contributions to the text: Andrew Sullivan, Simon Perreault, Jean-Philippe Dionne, Dave Thaler, Russ Housley, Alissa Cooper, Joe Abley, Joao Damas, Daniel Karrenberg, Jacques Latour, Eliot Lear, Bill Manning, David Conrad, Paul Hoffman, Terry Manderson, Jari Arkko, and Mark Andrews.
