Abstract
IPv4-over-IPv6 transition mechanisms provide IPv4 connectivity services over IPv6 native networks during the IPv4/IPv6 coexistence period. DHCPv6 options have been defined to configure clients for Lightweight 4over6, Mapping of Address and Port with Encapsulation (MAP-E), Mapping of Address and Port using Translation (MAP-T) unicast softwire mechanisms, and multicast softwires. However, in many networks, configuration information is stored in an Authentication, Authorization, and Accounting (AAA) server, which utilizes the Remote Authentication Dial In User Service (RADIUS) protocol to provide centralized management for users. When a new transition mechanism is developed, new RADIUS attributes need to be defined correspondingly.

This document defines new RADIUS attributes to carry softwire configuration parameters based on Address plus Port from a AAA server to a Broadband Network Gateway. Both unicast and multicast attributes are covered.

Status of This Memo
This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

1. Introduction

Providers have started deploying and transitioning to IPv6. Several IPv4 service continuity mechanisms based on Address plus Port (A+P) [RFC6346] have been proposed for providing unicast IPv4-over-IPv6-only infrastructure, such as Mapping of Address and Port with Encapsulation (MAP-E) [RFC7597], Mapping of Address and Port using Translation (MAP-T) [RFC7599], and Lightweight 4over6 [RFC7596]. Also, [RFC8114] specifies a generic solution for the delivery of IPv4 multicast services to IPv4 clients over an IPv6 multicast network. For each of these mechanisms, DHCPv6 options have been specified for client configuration.

In many networks, user configuration information is stored in an Authentication, Authorization, and Accounting (AAA) server. AAA servers generally communicate using the Remote Authentication Dial In User Service (RADIUS) [RFC2865] protocol. In a fixed broadband network, a Broadband Network Gateway (BNG) acts as the access gateway for users. That is, the BNG acts as both a AAA client to the AAA server and a DHCPv6 server for DHCPv6 messages sent by clients. Throughout this document, the term "BNG" describes a device implementing both the AAA client and DHCPv6 server functions.

Since IPv4-in-IPv6 softwire configuration information is stored in a AAA server and user configuration information is mainly transmitted through DHCPv6 between the BNGs and Customer Premises Equipment (CEs, a.k.a., CPE), new RADIUS attributes are needed to propagate the information from the AAA servers to BNGs so that they can be provided to CEs using the existing DHCPv6 options.

The RADIUS attributes defined in this document provide the configuration to populate the corresponding DHCPv6 options for unicast and multicast softwire configurations, specifically:

- "Mapping of Address and Port with Encapsulation (MAP-E)" [RFC7597] (DHCPv6 options defined in [RFC7598]).
- "Mapping of Address and Port using Translation (MAP-T)" [RFC7599] (DHCPv6 options defined in [RFC7598]).
- "Lightweight 4over6: An Extension to the Dual-Stack Lite Architecture" [RFC7596] (DHCPv6 options defined in [RFC7598]).
- "Unified IPv4-in-IPv6 Softwire Customer Premises Equipment (CPE): A DHCPv6-Based Prioritization Mechanism" [RFC8026].
- "Delivery of IPv4 Multicast Services to IPv4 Clients over an IPv6 Multicast Network" [RFC8114] (DHCPv6 options defined in [RFC8115]).

The contents of the attributes defined in this document have a 1:1 mapping into the fields of the various DHCPv6 options in [RFC7598], [RFC8026], and [RFC8115]. Table 1 shows how the DHCPv6 options map to the corresponding RADIUS attribute. For detailed mappings between each DHCPv6 option field and the corresponding RADIUS attribute or field, see Appendix A.
A RADIUS attribute for Dual-Stack Lite [RFC6333] is defined in [RFC6519].

This document targets deployments where a trusted relationship is in place between the RADIUS client and server.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The reader should be familiar with the concepts and terms defined in [RFC7596], [RFC7597], [RFC7599], and [RFC8026].

The terms "multicast Basic Bridging BroadBand" element (mB4) and "multicast Address Family Transition Router" element (mAFTR) are defined in [RFC8114].

Softwire46 (S46) is used throughout to denote any of the IPv4-in-IPv6 softwire mechanisms listed above. Additionally, the following abbreviations are used within the document:

BNG: Broadband Network Gateway
BR: Border Relay
CE: Customer Edge
CoA: Change-of-Authorization
DMR: Default Mapping Rule
EA: Embedded Address

Table 1: Mapping between DHCPv6 Options and RADIUS Attributes
3. New RADIUS Attributes

This section defines the following attributes:

1. Softwire46-Configuration Attribute (Section 3.1):

   This attribute carries the configuration information for MAP-E, MAP-T, and Lightweight 4over6. The configuration information for each Softwire46 mechanism is carried in the corresponding Softwire46 attributes. Different attributes are required for each Softwire46 mechanism.

2. Softwire46-Priority Attribute (Section 3.2):

   Depending on the deployment scenario, a client may support several different Softwire46 mechanisms. Therefore, a client may request configuration for more than one Softwire46 mechanism at a time. The Softwire46-Priority Attribute contains information allowing the client to prioritize which mechanism to use, corresponding to OPTION_S46_PRIORITY defined in [RFC8026].

3. Softwire46-Multicast Attribute (Section 3.3):

   This attribute conveys the IPv6 prefixes to be used in [RFC8114] to synthesize IPv4-embedded IPv6 addresses. The BNG uses the IPv6 prefixes returned in the RADIUS Softwire46-Multicast Attribute to populate the DHCPv6 PREFIX64 Option [RFC8115].

All of these attributes are allocated from the RADIUS "Extended Type" code space per [RFC6929].

All of these attribute designs follow [RFC6158] and [RFC6929].

This document adheres to the guidance in [RFC8044] for defining new RADIUS attributes.

3.1. Softwire46-Configuration Attribute

This attribute is of type "tlv", as defined in "Remote Authentication Dial-In User Service (RADIUS) Protocol Extensions" [RFC6929]. It contains some sub-attributes, with the following requirements:

- The Softwire46-Configuration Attribute MUST contain one or more of the following attributes: Softwire46-MAP-E, Softwire46-MAP-T, and/or Softwire46-Lightweight-4over6.
• The Softwire46-Configuration Attribute conveys the configuration information for MAP-E, MAP-T, or Lightweight 4over6. The BNG SHALL use the configuration information returned in the RADIUS attribute to populate the DHCPv6 Softwire46 container option(s) defined in Section 5 of [RFC7598].

• The Softwire46-Configuration Attribute MAY appear in an Access-Accept packet. It MAY also appear in an Access-Request packet to indicate a preferred Softwire46 configuration. However, the server is not required to honor such a preference.

• The Softwire46-Configuration Attribute MAY appear in a CoA-Request packet.

• The Softwire46-Configuration Attribute MAY appear in an Accounting-Request packet.

• The Softwire46-Configuration Attribute MUST NOT appear in any other RADIUS packet.

The Softwire46-Configuration Attribute is structured as follows:

Type
241

Length
Indicates the total length, in bytes, of all fields of this attribute, including the Type, Length, Extended-Type, and the entire length of the embedded attributes.

Extended-Type
9

Value
Contains one or more of the following attributes. Each attribute type may appear once at most:

Softwire46-MAP-E
For configuring MAP-E clients. For the construction of this attribute, refer to Section 3.1.1.1.

Softwire46-MAP-T
For configuring MAP-T clients. For the construction of this attribute, refer to Section 3.1.1.2.

Softwire46-Lightweight-4over6
For configuring Lightweight 4over6 clients. For the construction of this attribute, refer to Section 3.1.1.3.

The Softwire46-Configuration Attribute is associated with the following identifier: 241.9.

3.1.1. Softwire46 Attributes

The Softwire46 attributes can only be encapsulated in the Softwire46-Configuration Attribute. Depending on the deployment scenario, a client might request more than one transition mechanism at a time. There MUST be at least one Softwire46 attribute encapsulated in one Softwire46-Configuration Attribute. There MUST be at most one instance of each type of Softwire46 attribute encapsulated in one Softwire46-Configuration Attribute.
There are three types of Softwire46 attributes, namely:

1. Softwire46-MAP-E (Section 3.1.1.1)
2. Softwire46-MAP-T (Section 3.1.1.2)
3. Softwire46-Lightweight 4over6 (Section 3.1.1.3)

Each type of Softwire46 attribute contains a number of sub-attributes, defined in Section 3.1.3. The hierarchy of the Softwire46 attributes is shown in Figure 1. Section 3.1.2 describes which sub-attributes are mandatory, optional, or not permitted for each defined Softwire46 attribute.

### 3.1.1.1. Softwire46-MAP-E Attribute

The Softwire46-MAP-E attribute is designed to carry the configuration information for MAP-E.

The structure of Softwire46-MAP-E is shown below:

![Figure 1: Softwire46 Attribute Hierarchy](image)

**3.1.1.2. Softwire46-MAP-T Attribute**

The Softwire46-MAP-T attribute is designed to carry the configuration information for MAP-T. The structure of Softwire46-MAP-T is shown below:
TLV-Type

1

TLV-Length
Indicates the length of this attribute, including the TLV-Type, TLV-Length, and TLV-Value fields.

TLV-Value
Contains a set of sub-attributes, with the following requirements:

- It MUST contain Softwire46-Rule, defined in Section 3.1.3.1.
- It MUST contain Softwire46-BR, defined in Section 3.1.3.2.
- It MAY contain Softwire46-PORTPARAMS, defined in Section 3.1.3.5.

3.1.1.2. Softwire46-MAP-T Attribute
The Softwire46-MAP-T attribute is designed to carry the configuration information for MAP-T. The structure of Softwire46-MAP-T is shown below:

TLV-Type

2

TLV-Length
Indicates the length of this attribute, including the TLV-Type, TLV-Length, and TLV-Value fields.

TLV-Value
Contains a set of sub-attributes, with the following requirements:

- It MUST contain Softwire46-Rule, defined in Section 3.1.3.1.
- It MUST contain Softwire46-DMR, defined in Section 3.1.3.3.
- It MAY contain Softwire46-PORTPARAMS, defined in Section 3.1.3.5.

3.1.1.3. Softwire46-Lightweight-4over6 Attribute
The Softwire46-Lightweight-4over6 attribute is designed to carry the configuration information for Lightweight 4over6. The structure of Softwire46-Lightweight-4over6 is shown below:

TLV-Type

3

TLV-Length
Indicates the length of this attribute, including the TLV-Type, TLV-Length, and TLV-Value fields.

TLV-Value
Contains a set of sub-attributes as follows:
It **MUST** contain Softwire46-BR, defined in Section 3.1.3.2.

It **MUST** contain Softwire46-V4V6Bind, defined in Section 3.1.3.4.

It **MAY** contain Softwire46-PORTPARAMS, defined in Section 3.1.3.5.

### 3.1.2. Softwire46 Sub-attributes

Table 2 shows which encapsulated sub-attributes are mandatory, optional, or not permitted for each defined Softwire46 attribute.

<table>
<thead>
<tr>
<th>Sub-attributes</th>

</tbody>
</table>

*Table 2: Softwire46 Sub-attributes*

The following list defines the meaning of the Table 2 entries.

- **0** Not permitted
- **0-1** Optional; zero or one instance of the attribute may be present.
- **1** Mandatory; only one instance of the attribute must be present.
- **1+** Mandatory; one or more instances of the attribute may be present.

### 3.1.3. Specification of the Softwire46 Sub-attributes

#### 3.1.3.1. Softwire46-Rule Attribute

Softwire46-Rule can only be encapsulated in Softwire46-MAP-E (Section 3.1.1.1) or Softwire46-MAP-T (Section 3.1.1.2). Depending on the deployment scenario, one Basic Mapping Rule (BMR) and zero or more Forwarding Mapping Rules (FMRs) **MUST** be included in Softwire46-MAP-E and Softwire46-MAP-T.

Each type of Softwire46-Rule also contains a number of sub-attributes, including Rule-IPv6-Prefix, Rule-IPv4-Prefix, and EA-Length. The structure of the sub-attributes for Softwire46-Rule is defined in Section 3.1.4.

Defining multiple TLV types achieves the same design goals as the "Softwire46 Rule Flags" defined in Section 4.1 of [RFC7598]. Using a TLV type set to 5 is equivalent to setting the F flag in the OPTION_S46_RULE S46 Rule Flags field.

**TLV-Type**

- **4** Basic Mapping Rule only (not to be used for forwarding)
5 Forwarding Permitted Mapping Rule

**TLV-Length**
Indicates the length of this attribute, including the TLV-Type, TLV-Length, and TLV-Value fields.

**Data Type**
The attribute Softwire46-Rule is of type "tlv" (Section 3.13 of [RFC8044]).

**TLV-Value**
This field contains a set of attributes as follows:

- **Rule-IPv6-Prefix**
  This attribute contains the IPv6 prefix for use in the MAP rule. Refer to Section 3.1.4.1.

- **Rule-IPv4-Prefix**
  This attribute contains the IPv4 prefix for use in the MAP rule. Refer to Section 3.1.4.2.

- **EA-Length**
  This attribute contains the Embedded Address (EA) bit length. Refer to Section 3.1.4.3.

3.1.3.2. **Softwire46-BR Attribute**
Softwire46-BR can only be encapsulated in Softwire46-MAP-E (Section 3.1.1.1) or Softwire46-Lightweight-4over6 (Section 3.1.1.3).

There MUST be at least one Softwire46-BR included in each Softwire46-MAP-E or Softwire46-Lightweight-4over6.

The structure of Softwire46-BR is shown below:

**TLV-Type**
6

**TLV-Length**
18 octets

**Data Type**
The attribute Softwire46-BR is of type "ipv6addr" (Section 3.9 of [RFC8044]).

**TLV-Value**
br-ipv6-address. A fixed-length field of 16 octets that specifies the IPv6 address for the Softwire46 Border Relay (BR).

3.1.3.3. **Softwire46-DMR Attribute**
Softwire46-DMR may only appear in Softwire46-MAP-T (Section 3.1.1.2). There MUST be exactly one Softwire46-DMR included in one Softwire46-MAP-T.
The structure of Softwire46-DMR is shown below:

TLV-Type
7

TLV-Length
4 + length of dmr-ipv6-prefix specified in octets.

Data Type
The attribute Softwire46-DMR is of type “ipv6prefix” (Section 3.10 of [RFC8044]).

TLV-Value
A variable-length (dmr-prefix6-len) field specifying the IPv6 prefix (dmr-ipv6-prefix) for the BR. This field is right-padded with zeros to the nearest octet boundary when dmr-prefix6-len is not divisible by 8. Prefixes with lengths from 0 to 96 are allowed.

3.1.3.4. Softwire46-V4V6Bind Attribute
Softwire46-V4V6Bind may only be encapsulated in Softwire46-Lightweight-4over6 (Section 3.1.1.3). There MUST be exactly one Softwire46-V4V6Bind included in each Softwire46-Lightweight-4over6.

The structure of Softwire46-V4V6Bind is shown below:

TLV-Type
8

TLV-Length
Indicates the length of this attribute, including the TLV-Type, TLV-Length, and TLV-Value fields.

Data Type
The attribute Softwire46-V4V6Bind is of type “tlv” (Section 3.13 of [RFC8044]).

TLV-Value
This field contains a set of attributes as follows:

IPv4-Address
This attribute contains an IPv4 address, used to specify the full or shared IPv4 address of the CE. Refer to Section 3.1.5.1.

Bind-IPv6-Prefix
This attribute contains an IPv6 prefix used to indicate which configured prefix the Softwire46 CE should use for constructing the softwire. Refer to Section 3.1.5.2.

3.1.3.5. Softwire46-PORTPARAMS Attribute
Softwire46-PORTPARAMS is optional. It is used to specify port set information for IPv4 address sharing between clients. Softwire46-PORTPARAMS MAY be included in any of the Softwire46 attributes.
The structure of Softwire46-PORTPARAMS is shown below:

**TLV-Type**
9

**TLV-Length**
Indicates the length of this attribute, including the TLV-Type, TLV-Length, and TLV-Value fields.

**Data Type**
The attribute Softwire46-PORTPARAMS is of type “tlv” (Section 3.13 of [RFC8044]).

**TLV-Value**
This field contains a set of attributes as follows:

1. **PSID-Offset**
   This attribute specifies the numeric value for the Softwire46 algorithm's excluded port range/offset bits (a bits). Refer to Section 3.1.6.1.

2. **PSID-Len**
   This attribute specifies the number of significant bits in the PSID field (also known as 'k'). Refer to Section 3.1.6.2.

3. **PSID**
   This attribute specifies the PSID value. Refer to Section 3.1.6.3.

### 3.1.4. Sub-attributes for Softwire46-Rule

There are two types of Softwire46-Rule: the Basic Mapping Rule and the Forwarding Mapping Rule, indicated by the value in the TLV-Type field of Softwire46-Rule (Section 3.1.3.1).

Each type of Softwire46-Rule also contains a number of sub-attributes as detailed in the following subsections.

#### 3.1.4.1. Rule-IPv6-Prefix Attribute

Rule-IPv6-Prefix is **REQUIRED** for every Softwire46-Rule. There MUST be exactly one Rule-IPv6-Prefix encapsulated in each type of Softwire46-Rule.

Rule-IPv6-Prefix follows the framed IPv6 prefix designed in [RFC3162] and [RFC8044].

The structure of Rule-IPv6-Prefix is shown below:

**TLV-Type**
10

**TLV-Length**
4 + length of rule-ipv6-prefix specified in octets.

**Data Type**
The attribute Rule-IPv6-Prefix is of type “ipv6prefix” (Section 3.10 of [RFC8044]).
3.1.5. Attributes for Softwire46-v4v6Bind

**TLV-Value**

A variable-length field that specifies an IPv6 prefix (rule-ipv6-prefix) appearing in the MAP rule.

### 3.1.4.2. Rule-IPv4-Pref Field

This attribute is used to convey the MAP Rule IPv4 prefix. The structure of Rule-IPv4-Prefix is shown below:

- **TLV-Type**: 11
- **TLV-Length**: 4 + length of rule-ipv4-prefix specified in octets.
- **Data Type**: The attribute Rule-IPv4-Prefix is of type "ipv4prefix" ([RFC8044](https://tools.ietf.org/html/rfc8044)).
- **TLV-Value**: A variable-length field that specifies an IPv4 prefix (rule-ipv4-prefix) appearing in the MAP rule.

#### 3.1.4.3. EA-Length Attribute

This attribute is used to convey the Embedded Address (EA) bit length. The structure of EA-Length is shown below:

- **TLV-Type**: 12
- **TLV-Length**: 6 octets
- **Data Type**: The attribute EA-Length is of type "integer" ([RFC8044](https://tools.ietf.org/html/rfc8044)).
- **TLV-Value**: EA-len; 32 bits long. Specifies the Embedded Address (EA) bit length. Allowed values range from 0 to 48.

### 3.1.5. Attributes for Softwire46-v4v6Bind

#### 3.1.5.1. IPv4-Address Attribute

The IPv4-Address MAY be used to specify the full or shared IPv4 address of the CE.

The structure of IPv4-Address is shown below:

- **TLV-Type**: 13
- **TLV-Length**
6 octets

Data Type
The attribute IPv4-Address is of type “ipv4addr” (Section 3.8 of [RFC8044]).

TLV-Value
32 bits long. Specifies the IPv4 address (ipv4-address) to appear in Softwire46-V4V6Bind (Section 3.1.3.4).

3.1.5.2. Bind-IPv6-Prefix Attribute
The Bind-IPv6-Prefix is used by the CE to identify the correct IPv6 prefix to be used as the tunnel source.

The structure of Bind-IPv6-Prefix is shown below:

TLV-Type
14

TLV-Length
4 + length of bind-ipv6-prefix specified in octets.

Data Type
The attribute Bind-IPv6-Prefix is of type “ipv6prefix” (Section 3.10 of [RFC8044]).

TLV-Value
A variable-length field specifying the IPv6 prefix or address for the Softwire46 CE (bind-ipv6-prefix). This field is right-padded with zeros to the nearest octet boundary when the prefix length is not divisible by 8.

3.1.6. Attributes for Softwire46-PORTPARAMS

3.1.6.1. PSID-Offset Attribute
This attribute is used to convey the Port Set Identifier offset as defined in [RFC7597]. This attribute is encoded in 32 bits as per the recommendation in Appendix A.2.1 of [RFC6158].

The structure of PSID-Offset is shown below:

TLV-Type
15

TLV-Length
6 octets

Data Type
The attribute PSID-Offset is of type “integer” (Section 3.1 of [RFC8044]).

TLV-Value
Contains the PSID-Offset (8 bits) right justified, and the unused bits in this field MUST be set to zero. This field specifies the numeric value for the Softwire46 algorithm's excluded port range/offset bits (a bits), as per Section 5.1 of [RFC7597].
Default values for this field are specific to the software mechanism being implemented and are defined in the relevant specification document.

3.1.6.2. **PSID-Len Attribute**

This attribute is used to convey the PSID length as defined in [RFC7597]. This attribute is encoded in 32 bits as per the recommendation in Appendix A.2.1 of [RFC6158].

The structure of PSID-Len is shown below:

<table>
<thead>
<tr>
<th>TLV-Type</th>
<th>16</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLV-Length</td>
<td>6 octets</td>
</tr>
</tbody>
</table>

Data Type

The attribute PSID-Len is of type "integer" (Section 3.1 of [RFC8044]).

TLV-Value

Contains the PSID-len (8 bits) right justified, and the unused bits in this field **MUST** be set to zero. This field specifies the number of significant bits in the PSID field (also known as 'k'). When set to 0, the PSID field is to be ignored. After the first a bits, there are k bits in the port number representing the value of the PSID. Subsequently, the address-sharing ratio would be $2^k$.

3.1.6.3. **PSID Attribute**

This attribute is used to convey the PSID as defined in [RFC7597]. This attribute is encoded in 32 bits as per the recommendation in Appendix A.2.1 of [RFC6158].

The structure of PSID is shown below:

<table>
<thead>
<tr>
<th>TLV-Type</th>
<th>17</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLV-Length</td>
<td>6 octets</td>
</tr>
</tbody>
</table>

Data Type

The attribute PSID is of type "integer" (Section 3.1 of [RFC8044]).

TLV-Value

Contains the PSID (16 bits) right justified, and the unused bits in this field **MUST** be set to zero.

The PSID value algorithmically identifies a set of ports assigned to a CE. The first k bits on the left of this 2-octet field are the PSID value. The remaining (16-k) bits on the right are padding zeros.
3.2. Softwire46-Priority Attribute

The Softwire46-Priority Attribute includes an ordered list of Softwire46 mechanisms allowing the client to prioritize which mechanism to use, corresponding to OPTION_S46_PRIORITY defined in [RFC8026]. The following requirements apply:

- The Softwire46-Priority Attribute MAY appear in a CoA-Request packet.
- The Softwire46-Priority Attribute MAY appear in an Accounting-Request packet.
- The Softwire46-Priority Attribute MUST NOT appear in any other RADIUS packet.

The Softwire46-Priority Attribute is structured as follows:

Type
241

Length
Indicates the length of this attribute, including the Type, Length, Extended-Type and Value fields.

Extended-Type
10

TLV-Value
- The attribute includes one or more Softwire46-Option-Code TLVs: A Softwire46-Priority Attribute MUST contain at least one Softwire46-Option-Code TLV (Section 3.2.1).

Softwire46 mechanisms are prioritized in the appearance order in the Softwire46-Priority Attribute. That is, the first-appearing mechanism is most preferred.

The Softwire46-Priority Attribute is associated with the following identifier: 241.10.

3.2.1. Softwire46-Option-Code

This attribute is used to convey an option code assigned to a Softwire46 mechanism [RFC8026]. This attribute is encoded in 32 bits as per the recommendation in Appendix A.2.1 of [RFC6158].

The structure of Softwire46-Option-Code is shown below:

TLV-Type
18

TLV-Length
6 octets

Data Type
- The attribute Softwire46-Option-Code is of type "integer" (Section 3.1 of [RFC8044]).

TLV-Value
A 32-bit IANA-registered option code representing a Softwire46 mechanism (Softwire46-option-code). The codes and their corresponding Softwire46 mechanisms are listed in Section 7.3.

### 3.3. Softwire46-Multicast Attribute

The Softwire46-Multicast Attribute conveys the IPv6 prefixes to be used to synthesize multicast and unicast IPv4-embedded IPv6 addresses as per [RFC8114]. This attribute is of type "tlv" and contains additional TLVs. The following requirements apply:

- The BNG **SHALL** use the IPv6 prefixes returned in the RADIUS Softwire46-Multicast Attribute to populate the DHCPv6 PREFIX64 Option [RFC8115].
- This attribute **MAY** be used in Access-Request packets as a hint to the RADIUS server. For example, if the BNG is preconfigured for Softwire46-Multicast, these prefixes may be inserted in the attribute. The RADIUS server **MAY** ignore the hint sent by the BNG, and it **MAY** assign a different Softwire46-Multicast Attribute.
- The Softwire46-Multicast Attribute **MUST NOT** appear in any other RADIUS packet.
- The Softwire46-Multicast Attribute **MAY** contain ASM-Prefix64 (Section 3.3.1), SSM-Prefix64 (Section 3.3.2), and U-Prefix64 (Section 3.3.3).
- The Softwire46-Multicast Attribute **MUST** include ASM-Prefix64 or SSM-Prefix64, and it **MAY** include both.
- The U-Prefix64 **MUST** be present when SSM-Prefix64 is present. U-Prefix64 **MAY** be present when ASM-Prefix64 is present.

The Softwire46-Multicast Attribute is structured as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>241</td>
</tr>
<tr>
<td><strong>Length</strong></td>
<td></td>
</tr>
<tr>
<td>This field indicates the total length in bytes of all fields of this attribute, including the Type, Length, Extended-Type, and the entire length of the embedded attributes.</td>
<td></td>
</tr>
<tr>
<td><strong>Extended-Type</strong></td>
<td>11</td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td></td>
</tr>
<tr>
<td>This field contains a set of attributes as follows:</td>
<td></td>
</tr>
<tr>
<td><strong>ASM-Prefix64</strong></td>
<td>This attribute contains the Any-Source Multicast (ASM) IPv6 prefix. Refer to Section 3.3.1.</td>
</tr>
<tr>
<td><strong>SSM-Prefix64</strong></td>
<td></td>
</tr>
</tbody>
</table>
This attribute contains the Source-Source Multicast (SSM) IPv6 prefix. Refer to Section 3.3.2.

U-Prefix64
This attribute contains the IPv4 prefix used for address translation. Refer to Section 3.3.3.

The Softwire46-Multicast Attribute is associated with the following identifier: 241.11.

3.3.1. ASM-Prefix64 Attribute
The ASM-Prefix64 attribute is structured as follows:

TLV-Type
19

TLV-Length
16 octets. The length of asm-prefix64 must be /96 [RFC8115].

Data Type
The attribute ASM-Prefix64 is of type “ipv6prefix” (Section 3.10 of [RFC8044]).

TLV-Value
This field specifies the IPv6 multicast prefix (asm-prefix64) to be used to synthesize the IPv4-embedded IPv6 addresses of the multicast groups in the ASM mode. The conveyed multicast IPv6 prefix MUST belong to the ASM range.

3.3.2. SSM-Prefix64 Attribute
The SSM-Prefix64 attribute is structured as follows:

Type
20

TLV-Length
16 octets. The length of ssm-prefix64 must be /96 [RFC8115].

Data Type
The attribute SSM-Prefix64 is of type “ipv6prefix” (Section 3.10 of [RFC8044]).

TLV-Type
This field specifies the IPv6 multicast prefix (ssm-prefix64) to be used to synthesize the IPv4-embedded IPv6 addresses of the multicast groups in the SSM mode. The conveyed multicast IPv6 prefix MUST belong to the SSM range.

3.3.3. U-Prefix64 Attribute
The structure of U-Prefix64 is shown below:

TLV-Type
21
4. A Sample Configuration Process with RADIUS

Figure 2 illustrates how the RADIUS and DHCPv6 protocols interwork to provide CE with softwire configuration information.

Figure 2: Interaction between DHCPv6 and AAA Server with RADIUS Authentication

1. The CE creates a DHCPv6 Solicit message. For unicast softwire configuration, the message includes an OPTION_REQUEST_OPTION (6) with the Softwire46 Container option code(s) as defined in [RFC7598]. OPTION_S46_CONT_MAP_E (94) should be included for MAP-E,
OPTION_S46_CONT_MAPT (95) for MAP-T, and OPTION_S46_CONT_LW (96) for Lightweight 4over6. For multicast configuration, the option number for OPTION_V6_PREFIX64 (113) is included in the client's Option Request Option (ORO). The message is sent to the BNG.

2. On receipt of the DHCPv6 Solicit message, the BNG constructs a RADIUS Access-Request message containing a User-Name Attribute (1) (containing either a CE Media Access Control (MAC) address, interface-id, or both) and a User-Password Attribute (2) (with a preconfigured shared password between the CE and AAA server as defined in [RFC2865]). The Softwire46-Configuration Attribute and/or Softwire46-Multicast Attribute are also included (as requested by the client). The resulting message is sent to the AAA server.

3. The AAA server authenticates the request. If this is successful, and a suitable configuration is available, an Access-Accept message is sent to the BNG containing the requested Softwire46-Configuration Attribute or Softwire46-Multicast Attribute. It is the responsibility of the AAA server to ensure the consistency of the provided configuration.

4. The BNG maps the received softwire configuration into the corresponding fields in the DHCPv6 softwire configuration option(s). These are included in the DHCPv6 Advertise message, which is sent to the CE.

5. The CE sends a DHCPv6 Request message. In the ORO, the option codes of any of the required softwire options that were received in the DHCPv6 Advertise message are included.

6. The BNG sends a DHCPv6 Reply message to the client containing the softwire container option(s) enumerated in the ORO.

The authorization operation could be done independently after the authentication process. In this case, steps 1-5 are completed as above, then the following steps are performed:

6a. When the BNG receives the DHCPv6 Request, it constructs a RADIUS Access-Request message, which contains a Service-Type Attribute (6) with the value "Authorize Only" (17), the corresponding Softwire46-Configuration Attribute, and a State Attribute obtained from the previous authentication process according to [RFC5080]. The resulting message is sent to the AAA server.

7a. The AAA server checks the authorization request. If it is approved, an Access-Accept message is returned to the BNG with the corresponding Softwire46-Configuration Attribute.

8a. The BNG sends a Reply message to the client containing the softwire container options enumerated in the ORO.

In addition to the above, the following points need to be considered:

- In the configuration message flows described above, the Message-Authenticator (type 80) [RFC2869] should be used to protect both Access-Request and Access-Accept messages.
- If the BNG does not receive the corresponding Softwire46-Configuration Attribute in the Access-Accept message, it may fall back to creating the DHCPv6 softwire configuration options using the preconfigured Softwire46 configuration if this is present.
- If the BNG receives an Access-Reject from the AAA server, then the Softwire46 configuration must not be supplied to the client.
• As specified in Section 18.2.5 of [RFC8415] ("Creation and Transmission of Rebind Messages") if the DHCPv6 server to which the DHCPv6 Renew message was sent at time T1 has not responded by time T2, the CE (DHCPv6 client) should enter the Rebind state and attempt to contact any available server. In this situation, a secondary BNG receiving the DHCPv6 message must initiate a new Access-Request message towards the AAA server. The secondary BNG includes the Softwire46-Configuration Attribute in this Access-Request message.

• For Lightweight 4over6, the CE’s binding state needs to be synchronized between the clients and the Lightweight AFTR (lwAFTR)/BR. This can be achieved in two ways: static preconfiguration of the bindings on both the AAA server and lwAFTR or on demand, whereby the AAA server updates the lwAFTR with the CE’s binding state as it is created or deleted.

In some deployments, the DHCP server may use the Accounting-Request to report the softwire configuration returned to a requesting host to a AAA server. It is the responsibility of the DHCP server to ensure the consistency of the configuration provided to the requesting hosts. Reported data to a AAA server may be required for various operational purposes (e.g., regulatory).

A configuration change (e.g., BR address) may result in an exchange of CoA-Requests between the BNG and the AAA server, as shown in Figure 3. Concretely, when the BNG receives a CoA-Request message containing Softwire46 attributes, it sends a DHCPv6 Reconfigure message to the appropriate CE to inform that CE that an updated configuration is available. Upon receipt of such a message, the CE sends a DHCPv6 Renew or Information-Request in order to receive the updated Softwire46 configuration. In deployments where the BNG embeds a DHCPv6 relay, CoA-Requests can be used following the procedure specified in [RFC6977].

![Figure 3: Change of Configuration Example](image-url)
5. Table of Attributes

This document specifies three new RADIUS attributes, and their formats are as follows:

- Softwire46-Configuration Attribute: 241.9
- Softwire46-Priority Attribute: 241.10
- Softwire46-Multicast Attribute: 241.11

Table 3 describes which attributes may be found in which kinds of packets and in what quantity.

<table>
<thead>
<tr>
<th>Request</th>
<th>Accept</th>
<th>Reject</th>
<th>Challenge</th>
<th>Acct Req</th>
<th>CoA-Req</th>
<th>#</th>
<th>Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-1</td>
<td>0-1</td>
<td>0</td>

<td>0</td>
<td>0-1</td>
<td>0-1</td>
<td>241.11</td>
<td>Softwire46-Multicast</td>
</tr>
</tbody>
</table>

Table 3: Table of Attributes

6. Security Considerations

Section 9 of [RFC7596] discusses security issues related to Lightweight 4over6; Section 10 of [RFC7597] discusses security issues related to MAP-E; Section 13 of [RFC7599] discusses security issues related to MAP-T; and Section 9 of [RFC8114] discusses security issues related to the delivery of IPv4 multicast services to IPv4 clients over an IPv6 multicast network.

This document does not introduce any security issues inherently different from those already identified in Section 8 of [RFC2865] and Section 6 of [RFC5176] for CoA messages. Known security vulnerabilities of the RADIUS protocol discussed in Section 7 of [RFC2607] and Section 7 of [RFC2869] apply to this specification. These well-established properties of the RADIUS protocol place some limitations on how it can safely be used, since there is some inherent requirement to trust the counterparty to not misbehave.

Accordingly, this document targets deployments where a trusted relationship is in place between the RADIUS client and server, with communication optionally secured by IPsec or Transport Layer Security (TLS) [RFC6614]. The use of IPsec [RFC4301] for providing security when RADIUS is carried in IPv6 is discussed in [RFC3162].

Security considerations for interactions between a Softwire46 CE and the BNG are discussed in Section 9 of [RFC7598] (DHCPv6 options for the configuration of Softwire46 address and port-mapped clients), Section 3 of [RFC8026] (a DHCPv6-based Softwire46 prioritization mechanism), and Section 5 of [RFC8115] (DHCPv6 options for configuration of IPv4-embedded IPv6 prefixes).
7. IANA Considerations

IANA has made new code point assignments for RADIUS attributes as described in the following subsections. The assignments should use the RADIUS registry available at <https://www.iana.org/assignments/radius-types/>.

7.1. New RADIUS Attributes

IANA has assigned the attribute types defined in this document from the RADIUS namespace as described in Section 2 (IANA Considerations) of [RFC3575], in accordance with BCP 26 [RFC8126].

IANA has registered three new RADIUS attributes from the "Short Extended Space" section of [RFC6929]. The attributes are the Softwire46-Configuration Attribute, Softwire46-Priority Attribute, and Softwire46-Multicast Attribute:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Data Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>241.9</td>
<td>Softwire46-Configuration</td>
<td>tlv</td>
<td>Section 3.1</td>
</tr>
<tr>
<td>241.10</td>
<td>Softwire46-Priority</td>
<td>tlv</td>
<td>Section 3.2</td>
</tr>
<tr>
<td>241.11</td>
<td>Softwire46-Multicast</td>
<td>tlv</td>
<td>Section 3.3</td>
</tr>
</tbody>
</table>

Table 4: New RADIUS Attributes

7.2. RADIUS Softwire46 Configuration and Multicast Attributes

IANA has created a new registry called "RADIUS Softwire46 Configuration and Multicast Attributes".

All attributes in this registry have one or more parent RADIUS attributes in nesting (refer to [RFC6929]).

This registry has been initially populated with the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
<th>Data Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Softwire46-MAP-E</td>
<td>tlv</td>
<td>Section 3.1.1.1</td>
</tr>
<tr>
<td>2</td>
<td>Softwire46-MAP-T</td>
<td>tlv</td>
<td>Section 3.1.1.2</td>
</tr>
<tr>
<td>3</td>
<td>Softwire46-Lightweight-4over6</td>
<td>tlv</td>
<td>Section 3.1.1.3</td>
</tr>
<tr>
<td>4</td>
<td>Softwire46-Rule (BMR)</td>
<td>tlv</td>
<td>Section 3.1.3.1</td>
</tr>
<tr>
<td>5</td>
<td>Softwire46-Rule (FMR)</td>
<td>tlv</td>
<td>Section 3.1.3.1</td>
</tr>
</tbody>
</table>
The registration procedure for this registry is Standards Action as defined in [RFC8126].

### 7.3. Softwire46 Mechanisms and Their Identifying Option Codes

The Softwire46-Priority Attribute conveys an ordered list of option codes assigned to Softwire46 mechanisms, for which IANA has created and will maintain a new registry titled "Option Codes Permitted in the Softwire46-Priority Attribute".

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
<th>Data Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>

<td>Unassigned</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Table 5: RADIUS Softwire46 Configuration and Multicast Attributes*
Table 6 shows the initial version of allowed option codes and the Softwire46 mechanisms that they represent. The option code for DS-Lite is derived from the IANA-allocated RADIUS Attribute Type value for DS-Lite [RFC6519]. The option codes for MAP-E, MAP-T, and Lightweight 4over6 are the TLV-Type values for the MAP-E, MAP-T, and Lightweight 4over6 attributes defined in Section 3.1.1.

<table>
<thead>
