Abstract

Digital signatures are used to sign messages, X.509 certificates, and Certificate Revocation Lists (CRLs). This document updates the "Algorithms and Identifiers for the Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile" (RFC 3279) and describes the conventions for using the SHAKE function family in Internet X.509 certificates and revocation lists as one-way hash functions with the RSA Probabilistic signature and Elliptic Curve Digital Signature Algorithm (ECDSA) signature algorithms. The conventions for the associated subject public keys are also described.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at https://www.rfc-editor.org/info/rfc8692.

Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

[ RFC3279 ] defines cryptographic algorithm identifiers for the "Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile" [ RFC5280 ]. This document updates RFC 3279 and defines identifiers for several cryptographic algorithms that use variable-length output SHAKE functions introduced in [ SHA3 ] which can be used with RFC 5280.

In the SHA-3 family, two extendable-output functions (SHAKEs) are defined: SHAKE128 and SHAKE256. Four other hash function instances, SHA3-224, SHA3-256, SHA3-384, and SHA3-512, are also defined but are out of scope for this document. A SHAKE is a variable-length hash function defined as SHAKE(M, d) where the output is a d-bits-long digest of message M. The corresponding collision and second-preimage-resistance strengths for SHAKE128 are min(d/2,
128) and min(d, 128) bits, respectively (see Appendix A.1 of [SHA3]). And the corresponding collision and second-preimage-resistance strengths for SHAKE256 are min(d/2, 256) and min(d, 256) bits, respectively.

A SHAKE can be used as the message digest function (to hash the message to be signed) in RSA Probabilistic Signature Scheme (RSASSA-PSS) [RFC8017] and ECDSA [X9.62] and as the hash in the mask generation function (MGF) in RSASSA-PSS.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. Identifiers

This section defines four new object identifiers (OIDs), for RSASSA-PSS and ECDSA with each of SHAKE128 and SHAKE256. The same algorithm identifiers can be used for identifying a public key in RSASSA-PSS.

The new identifiers for RSASSA-PSS signatures using SHAKEs are below.

```plaintext
id-RSASSA-PSS-SHAKE128  OBJECT IDENTIFIER  ::=  { iso(1)
    identified-organization(3) dod(6) internet(1)
    security(5) mechanisms(5) pkix(7) algorithms(6)
    30 }

id-RSASSA-PSS-SHAKE256  OBJECT IDENTIFIER  ::=  { iso(1)
    identified-organization(3) dod(6) internet(1)
    security(5) mechanisms(5) pkix(7) algorithms(6)
    31 }
```

The new algorithm identifiers of ECDSA signatures using SHAKEs are below.

```plaintext
id-ecdsa-with-shake128  OBJECT IDENTIFIER  ::=  { iso(1)
    identified-organization(3) dod(6) internet(1)
    security(5) mechanisms(5) pkix(7) algorithms(6)
    32 }

id-ecdsa-with-shake256  OBJECT IDENTIFIER  ::=  { iso(1)
    identified-organization(3) dod(6) internet(1)
    security(5) mechanisms(5) pkix(7) algorithms(6)
    33 }
```

The parameters for the four identifiers above MUST be absent. That is, the identifier SHALL be a SEQUENCE of one component: the OID.
Sections 4.1.1 and 4.1.2 specify the required output length for each use of SHAKE128 or SHAKE256 in RSASSA-PSS and ECDSA. In summary, when hashing messages to be signed, output lengths of SHAKE128 and SHAKE256 are 256 and 512 bits, respectively. When the SHAKEs are used as MGFs in RSASSA-PSS, their output length is \((8\times\text{ceil}(n-1)/8) - 264\) or \((8\times\text{ceil}(n-1)/8) - 520\) bits, respectively, where \(n\) is the RSA modulus size in bits.

### 4. Use in PKIX

#### 4.1. Signatures

Signatures are used in a number of different ASN.1 structures. As shown in the ASN.1 representation from [RFC5280] below, in an X.509 certificate, a signature is encoded with an algorithm identifier in the signatureAlgorithm attribute and a signatureValue attribute that contains the actual signature.

```plaintext
Certificate ::= SEQUENCE {
  tbsCertificate       TBSCertificate,
  signatureAlgorithm   AlgorithmIdentifier,
  signatureValue       BIT STRING
}
```

The identifiers defined in Section 3 can be used as the AlgorithmIdentifier in the signatureAlgorithm field in the sequence Certificate and the signature field in the sequence TBSCertificate in X.509 [RFC5280]. The parameters of these signature algorithms are absent, as explained in Section 3.

Conforming Certification Authority (CA) implementations MUST specify the algorithms explicitly by using the OIDs specified in Section 3 when encoding RSASSA-PSS or ECDSA with SHAKE signatures in certificates and CRLs. Conforming client implementations that process certificates and CRLs using RSASSA-PSS or ECDSA with SHAKE MUST recognize the corresponding OIDs. Encoding rules for RSASSA-PSS and ECDSA signature values are specified in [RFC4055] and [RFC5480], respectively.

When using RSASSA-PSS or ECDSA with SHAKEs, the RSA modulus and ECDSA curve order SHOULD be chosen in line with the SHAKE output length. Refer to Section 6 for more details.

#### 4.1.1. RSASSA-PSS Signatures

The RSASSA-PSS algorithm is defined in [RFC8017]. When id-RSASSA-PSS-SHAKE128 or id-RSASSA-PSS-SHAKE256 (specified in Section 3) is used, the encoding MUST omit the parameters field. That is, the AlgorithmIdentifier SHALL be a SEQUENCE of one component: id-RSASSA-PSS-SHAKE128 or id-RSASSA-PSS-SHAKE256. [RFC4055] defines RSASSA-PSS-params that is used to define the algorithms and inputs to the algorithm. This specification does not use parameters because the hash, mask generation algorithm, trailer, and salt are embedded in the OID definition.
The hash algorithm to hash a message being signed and the hash algorithm used as the MGF in RSASSA-PSS must be the same: both SHAKE128 or both SHAKE256. The output length of the hash algorithm that hashes the message shall be 32 bytes (for SHAKE128) or 64 bytes (for SHAKE256).

The MGF takes an octet string of variable length and a desired output length as input and outputs an octet string of the desired length. In RSASSA-PSS with SHAKEs, the SHAKEs must be used natively as the MGF, instead of the MGF1 algorithm that uses the hash function in multiple iterations, as specified in Appendix B.2.1 of RFC8017. In other words, the MGF is defined as the SHAKE128 or SHAKE256 output of the mgfSeed for id-RSASSA-PSS-SHAKE128 and id-RSASSA-PSS-SHAKE256, respectively. The mgfSeed is the seed from which the mask is generated, an octet string. As explained in Step 9 of Section 9.1.1 of RFC8017, the output length of the MGF is emLen - hLen - 1 bytes. emLen is the maximum message length ceil((n-1)/8), where n is the RSA modulus in bits. hLen is 32 and 64 bytes for id-RSASSA-PSS-SHAKE128 and id-RSASSA-PSS-SHAKE256, respectively. Thus, when SHAKE is used as the MGF, the SHAKE output length maskLen is (8*emLen - 264) or (8*emLen - 520) bits, respectively. For example, when RSA modulus n is 2048 bits, the output length of SHAKE128 or SHAKE256 as the MGF will be 1784 or 1528 bits when id-RSASSA-PSS-SHAKE128 or id-RSASSA-PSS-SHAKE256 is used, respectively.

The RSASSA-PSS saltLength must be 32 bytes for id-RSASSA-PSS-SHAKE128 or 64 bytes for id-RSASSA-PSS-SHAKE256. Finally, the trailerField must be 1, which represents the trailer field with hexadecimal value 0xBC.

4.1.2. ECDSA Signatures

The Elliptic Curve Digital Signature Algorithm (ECDSA) is defined in X9.62. When the id-ecdsa-with-shake128 or id-ecdsa-with-shake256 (specified in Section 3) algorithm identifier appears, the respective SHAKE function (SHAKE128 or SHAKE256) is used as the hash. The encoding must omit the parameters field. That is, the AlgorithmIdentifier shall be a SEQUENCE of one component: the OID id-ecdsa-with-shake128 or id-ecdsa-with-shake256.

For simplicity and compliance with the ECDSA standard specification X9.62, the output length of the hash function must be explicitly determined. The output length, d, for SHAKE128 or SHAKE256 used in ECDSA must be 256 or 512 bits, respectively.

Conforming CA implementations that generate ECDSA with SHAKE signatures in certificates or CRLs should generate such signatures with a deterministically generated, nonrandom k in accordance with all the requirements specified in RFC6979. They may also generate such signatures in accordance with all other recommendations in X9.62 or SEC1 if they have a stated policy that requires conformance to those standards. Those standards have not specified SHAKE128 and SHAKE256 as hash algorithm options. However, SHAKE128 and SHAKE256 with output length being 32 and 64 octets, respectively, can be used instead of 256- and 512-bit output hash algorithms such as SHA256 and SHA512.
4.2. Public Keys

Certificates conforming to [RFC5280] can convey a public key for any public key algorithm. The certificate indicates the public key algorithm through an algorithm identifier. This algorithm identifier is an OID with optionally associated parameters. The conventions and encoding for RSASSA-PSS and ECDSA public key algorithm identifiers are as specified in Sections 2.3.1 and 2.3.5 of [RFC3279], Section 3.1 of [RFC4055] and Section 2.1 of [RFC5480].

Traditionally, the rsaEncryption object identifier is used to identify RSA public keys. The rsaEncryption object identifier continues to identify the subject public key when the RSA private key owner does not wish to limit the use of the public key exclusively to RSASSA-PSS with SHAKEs. When the RSA private key owner wishes to limit the use of the public key exclusively to RSASSA-PSS with SHAKEs, the AlgorithmIdentifiers for RSASSA-PSS defined in Section 3 SHOULD be used as the algorithm field in the SubjectPublicKeyInfo sequence [RFC5280]. Conforming client implementations that process RSASSA-PSS with SHAKE public keys when processing certificates and CRLs MUST recognize the corresponding OIDs.

Conforming CA implementations MUST specify the X.509 public key algorithm explicitly by using the OIDs specified in Section 3 when encoding ECDSA with SHAKE public keys in certificates and CRLs. Conforming client implementations that process ECDSA with SHAKE public keys when processing certificates and CRLs MUST recognize the corresponding OIDs.

The identifier parameters, as explained in Section 3, MUST be absent.

5. IANA Considerations

One object identifier for the ASN.1 module in Appendix A has been assigned in the "SMI Security for PKIX Module Identifier" (1.3.6.1.5.5.7.0) registry:

<table>
<thead>
<tr>
<th>Decimal</th>
<th>Description</th>
<th>References</th>
</tr>
</thead>
<tbody>
<tr>
<td>94</td>
<td>id-mod-pkix1-shakes-2019</td>
<td>RFC 8692</td>
</tr>
</tbody>
</table>

Table 1

IANA has updated the "SMI Security for PKIX Algorithms" (1.3.6.1.5.5.7.6) registry [SMI-PKIX] with four additional entries:
IANA has updated the "Hash Function Textual Names" registry [Hash-Texts] with two additional entries for SHAKE128 and SHAKE256:

<table>
<thead>
<tr>
<th>Hash Function Name</th>
<th>OID</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>shake128</td>
<td>2.16.840.1.101.3.4.2.11</td>
<td>RFC 8692</td>
</tr>
<tr>
<td>shake256</td>
<td>2.16.840.1.101.3.4.2.12</td>
<td>RFC 8692</td>
</tr>
</tbody>
</table>

Table 3

6. Security Considerations

This document updates [RFC3279]. The Security Considerations section of that document applies to this specification as well.

NIST has defined appropriate use of the hash functions in terms of the algorithm strengths and expected time frames for secure use in Special Publications (SPs) [SP800-78-4] and [SP800-107]. These documents can be used as guides to choose appropriate key sizes for various security scenarios.

SHAKE128 with output length of 256 bits offers 128 bits of collision and preimage resistance. Thus, SHAKE128 OIDs in this specification are **RECOMMENDED** with 2048- (112-bit security) or 3072-bit (128-bit security) RSA modulus or curves with group order of 256 bits (128-bit security). SHAKE256 with a 512-bit output length offers 256 bits of collision and preimage resistance. Thus, the SHAKE256 OIDs in this specification are **RECOMMENDED** with 4096-bit RSA modulus or higher or curves with a group order of at least 512 bits, such as the NIST Curve P-521 (256-bit security). Note that we recommended a 4096-bit RSA because we would need a 15360-bit modulus for 256 bits of security, which is impractical for today's technology.
