RFC 8709
Ed25519 and Ed448 Public Key Algorithms for the Secure Shell (SSH) Protocol

Abstract
This document describes the use of the Ed25519 and Ed448 digital signature algorithms in the Secure Shell (SSH) protocol. Accordingly, this RFC updates RFC 4253.

Status of This Memo
This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at https://www.rfc-editor.org/info/rfc8709.

Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

Secure Shell (SSH) [RFC4251] is a secure remote-login protocol. It provides for an extensible variety of public key algorithms for identifying servers and users to one another. Ed25519 [RFC8032] is a digital signature system. OpenSSH 6.5 [OpenSSH-6.5] introduced support for using Ed25519 for server and user authentication and was then followed by other SSH implementations.

This document describes the method implemented by OpenSSH and others and formalizes the use of the name "ssh-ed25519". Additionally, this document describes the use of Ed448 and formalizes the use of the name "ssh-ed448".
2. Conventions Used in This Document

The descriptions of key and signature formats use the notation introduced in [RFC4251], Section 3 and the string data type from [RFC4251], Section 5.

2.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. Public Key Algorithm

This document describes a public key algorithm for use with SSH, as per [RFC4253], Section 6.6. The name of the algorithm is "ssh-ed25519". This algorithm only supports signing and not encryption.

Additionally, this document describes another public key algorithm. The name of the algorithm is "ssh-ed448". This algorithm only supports signing and not encryption.

Standard implementations of SSH SHOULD implement these signature algorithms.

4. Public Key Format

The "ssh-ed25519" key format has the following encoding:

```
string "ssh-ed25519"
string key
```

Here, 'key' is the 32-octet public key described in [RFC8032], Section 5.1.5.

The "ssh-ed448" key format has the following encoding:

```
string "ssh-ed448"
string key
```

Here, 'key' is the 57-octet public key described in [RFC8032], Section 5.2.5.

5. Signature Algorithm

Signatures are generated according to the procedure in Sections 5.1.6 and 5.2.6 of [RFC8032].
6. Signature Format
The "ssh-ed25519" key format has the following encoding:

```plaintext
string  "ssh-ed25519"
string  signature
```
Here, 'signature' is the 64-octet signature produced in accordance with [RFC8032], Section 5.1.6.

The "ssh-ed448" key format has the following encoding:

```plaintext
string  "ssh-ed448"
string  signature
```
Here, 'signature' is the 114-octet signature produced in accordance with [RFC8032], Section 5.2.6.

7. Verification Algorithm
Ed25519 signatures are verified according to the procedure in [RFC8032], Section 5.1.7.
Ed448 signatures are verified according to the procedure in [RFC8032], Section 5.2.7.

8. SSHFP DNS Resource Records
Usage and generation of the SSHFP DNS resource record is described in [RFC4255]. The generation of SSHFP resource records for "ssh-ed25519" keys is described in [RFC7479]. This section illustrates the generation of SSHFP resource records for "ssh-ed448" keys, and this document also specifies the corresponding Ed448 code point to "SSHFP RR Types for public key algorithms" in the "DNS SSHFP Resource Record Parameters" IANA registry [IANA-SSHFP].

The generation of SSHFP resource records for "ssh-ed448" keys is described as follows.
The encoding of Ed448 public keys is described in [ED448]. In brief, an Ed448 public key is a 57-octet value representing a 455-bit y-coordinate of an elliptic curve point, and a sign bit indicating the corresponding x-coordinate.

The SSHFP Resource Record for the Ed448 public key with SHA-256 fingerprint would, for example, be:

```
example.com. IN SSHFP 6 2 ( a87f1b687ac0e57d2a081a2f2826723 34d90ed316d2b818ca9580ea384d92401 )
```
The '2' here indicates SHA-256 [RFC6594].
9. IANA Considerations

This document augments the Public Key Algorithm Names in [RFC4250], Section 4.11.3.

IANA has added the following entry to "Public Key Algorithm Names" in the "Secure Shell (SSH) Protocol Parameters" registry [IANA-SSH]:

<table>
<thead>
<tr>
<th>Public Key Algorithm Name</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssh-ed25519</td>
<td>RFC 8709</td>
</tr>
<tr>
<td>ssh-ed448</td>
<td>RFC 8709</td>
</tr>
</tbody>
</table>

*Table 1*

IANA has added the following entry to "SSHFP RR Types for public key algorithms" in the "DNS SSHFP Resource Record Parameters" registry [IANA-SSHFP]:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Ed448</td>
<td>RFC 8709</td>
</tr>
</tbody>
</table>

*Table 2*

10. Security Considerations

The security considerations in [RFC4251], Section 9 apply to all SSH implementations, including those using Ed25519 and Ed448.

The security considerations in [RFC8032], Section 8 and [RFC7479], Section 3 apply to all uses of Ed25519 and Ed448, including those in SSH.
