Matroska Media Container Format Specifications

Abstract

This document defines the Matroska audiovisual data container structure, including definitions of its structural elements, terminology, vocabulary, and application.

This document updates RFC 8794 to permit the use of a previously reserved Extensible Binary Meta Language (EBML) Element ID.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at https://www.rfc-editor.org/info/rfc0000.

1. Introduction

Matroska is an audiovisual data container format. It was derived from a project called [MCF]; however, Matroska diverges from it significantly because it is based on Extensible Binary Meta Language (EBML), [RFC8794], which is a binary derivative of XML. EBML provides significant advantages in terms of future format extensibility without breaking file support in parsers reading the previous versions.

First, it is essential to clarify exactly "What an Audio/Video container is", to avoid any misunderstandings:

- It is NOT a video or audio compression format (codec).
- It is an envelope in which there can be many audio, video, and subtitles streams, allowing the user to store a complete movie or CD in a single file.
Matroska is designed with the future in mind. It incorporates features such as:

- Fast seeking in the file
- Chapter entries
- Full metadata (tags) support
- Selectable subtitle/audio/video streams
- Modularly expandable
- Error resilience (can recover playback even when the stream is damaged)
- Streamable over the internet and local networks (HTTP [RFC9110], FTP [RFC0959], SMB [SMB-CIFS], etc.)
- Menus (similar to menus that DVDs have [DVD-Video])

2. Status of This Document

This document covers Matroska versions 1, 2, 3, and 4. Matroska v4 is the current version. Matroska 1 to 3 are no longer maintained. No new elements are expected in files with version numbers 1, 2, or 3.

3. Notation and Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

This document defines specific terms in order to define the format and application of Matroska. These terms are listed below:

Matroska: A multimedia container format based on Extensible Binary Meta Language (EBML).
Matroska Reader: A data parser that interprets the semantics of a Matroska document and creates a way for programs to use Matroska.
Matroska Player: A Matroska Reader with the primary purpose of playing audiovisual files, including Matroska documents.
Matroska Writer: A data writer that creates Matroska documents.

4. Matroska Overview

4.1. Principles

Matroska is a Document Type of EBML. This specification is dependent on the EBML Specification [RFC8794]. For an understanding of Matroska's EBML Schema, see the following sections of [RFC8794] that cover EBML Element Types (Section 7 of [RFC8794]), EBML Schema (Section 11.1 of [RFC8794]), and EBML Structure (Section 3 of [RFC8794]).
4.2. Updates to RFC 8794

Because of an oversight, [RFC8794] reserved EBML ID 0x80, which is used by deployed Matroska implementations. For this reason, this specification updates [RFC8794] to make 0x80 a legal EBML ID. Additionally, this specification makes the following updates:

- **Section 17.1 of [RFC8794] (per Errata 7189 [Err7189])**

  OLD:

  One-octet Element IDs **MUST** be between 0x81 and 0xFE. These items are valuable because they are short, and they need to be used for commonly repeated elements. Element IDs are to be allocated within this range according to the "RFC Required" policy [RFC8126].

  The following one-octet Element IDs are RESERVED: 0xFF and 0x80.

  NEW:

  One-octet Element IDs **MUST** be between 0x80 and 0xFE. These items are valuable because they are short, and they need to be used for commonly repeated elements. Element IDs are to be allocated within this range according to the "RFC Required" policy [RFC8126].

  The following one-octet Element ID is RESERVED: 0xFF.

- **Section 5 of [RFC8794] (per Errata 7191 [Err7191])**
4.3. Added EBML Constraints

As an EBML Document Type, Matroska adds the following constraints to the EBML specification:

- The `docType` of the EBML Header **MUST** be "matroska".
- The `EBMLMaxIDLength` of the EBML Header **MUST** be 4.
- The `EBMLMaxSizeLength` of the EBML Header **MUST** be between 1 and 8 inclusive.

4.4. Design Rules

The Root Element and all Top-Level Elements **MUST** use 4 octets for their EBML Element ID – i.e., Segment and direct children of Segment.

Legacy EBML / Matroska parsers did not handle Empty Elements properly. Elements were present in the file, but had a length of 0. They always assumed the value was 0 for integers/dates or 0x0p+0, the textual expression of floats using the [ISO9899](http://www.iso.org/iso/iso_catalogue/catalogue_detail.htm?csnumber=15678) format, no matter the default value of the element which should have been used instead. Therefore, Matroska Writers **MUST NOT** use EBML Empty Elements, if the element has a default value that is not 0 for integers/dates and 0x0p+0 for floats.

When adding new elements to Matroska, these rules apply:

- A non-mandatory integer/date Element **MUST NOT** have a default value other than 0.
- A non-mandatory float Element **MUST NOT** have a default value other than 0x0p+0.
- A non-mandatory string Element **MUST NOT** have a default value, as empty strings cannot be defined in the XML Schema.
4.5. Data Layout

A Matroska file MUST be composed of at least one EBML Document using the Matroska Document Type. Each EBML Document MUST start with an EBML Header and MUST be followed by the EBML Root Element, defined as a Segment in Matroska. Matroska defines several Top-Level Elements that may occur within the Segment.

As an example, a simple Matroska file consisting of a single EBML Document could be represented like this:

- EBML Header
- Segment

A more complex Matroska file consisting of an EBML Stream (containing two EBML Documents) could be represented like this:

- EBML Header
- Segment
- EBML Header
- Segment

The following diagram represents a simple Matroska file, comprised of an EBML Document with an EBML Header, a Segment Element (the Root Element), and all eight Matroska Top-Level Elements. In the following diagrams of this section, horizontal spacing expresses a parent-child relationship between Matroska Elements (e.g., the Info Element is contained within the Segment Element), whereas vertical alignment represents the storage order within the file.
The Matroska EBML Schema defines eight Top-Level Elements:

- SeekHead (Section 6.3),
- Info (Section 6.5),
- Tracks (Section 18),
- Chapters (Section 20),
- Cluster (Section 10),
- Cues (Section 22),
- Attachments (Section 21),
- and Tags (Section 6.8).

The SeekHead Element (also known as MetaSeek) contains an index of Top-Level Elements locations within the Segment. Use of the SeekHead Element is RECOMMENDED. Without a SeekHead Element, a Matroska parser would have to search the entire file to find all of the other Top-Level Elements. This is due to Matroska’s flexible ordering requirements; for instance, it is acceptable for the Chapters Element to be stored after the Cluster Element.
The Info Element contains vital information for identifying the whole Segment. This includes the title for the Segment, a randomly generated unique identifier (UID), and the UID(s) of any linked Segment Elements.

Figure 3: Representation of an Info Element and Its Child Elements

The Tracks Element defines the technical details for each track and can store the name, number, UID, language, and type (audio, video, subtitles, etc.) of each track. For example, the Tracks Element MAY store information about the resolution of a video track or a sample rate of an audio track.

The Tracks Element MUST identify all the data needed by the codec to decode the data of the specified track. However, the data required is contingent on the codec used for the track. For example, a Track Element for uncompressed audio only requires the audio bit rate to be present. A codec such as AC-3 would require that the CodecID Element be present for all tracks, as it is the primary way to identify which codec to use to decode the track.
The Chapters Element lists all of the chapters. Chapters set predefined points to jump to in video or audio.

![Figure 4: Representation of the Tracks Element and a Selection of Its Descendant Elements](image)

The Chapters Element lists all of the chapters. Chapters set predefined points to jump to in video or audio.
Cluster Elements contain the content for each track, e.g., video frames. A Matroska file SHOULD contain at least one Cluster Element. In the rare case it doesn’t, there should be a form of Segment linking with other Segments, possibly using Chapters, see Section 17.

The Cluster Element helps to break up SimpleBlock or BlockGroup Elements and helps with seeking and error protection. Every Cluster Element MUST contain a Timestamp Element. This SHOULD be the Timestamp Element used to play the first Block in the Cluster Element, unless a different value is needed to accommodate for more Blocks; see Section 11.2.

Cluster Elements contain one or more block element, such as BlockGroup or SimpleBlock elements. In some situations, a Cluster Element MAY contain no block element, e.g., in a live recording when no data has been collected.

A BlockGroup Element MAY contain a Block of data and any information relating directly to that Block.

SHOULD

MUST

SHOULD

MAY

MAY
Each Cluster contains exactly one Timestamp Element. The Timestamp Element value must be stored once per Cluster. The Timestamp Element in the Cluster is relative to the entire Segment. The Timestamp Element should be the first Element in the Cluster it belongs to, or the second Element if that Cluster contains a CRC-32 element (Section 6.2).

Additionally, the Block contains an offset that, when added to the Cluster's Timestamp Element value, yields the Block's effective timestamp. Therefore, the timestamp in the Block itself is relative to the Timestamp Element in the Cluster. For example, if the Timestamp Element in the Cluster is set to 10 seconds and a Block in that Cluster is supposed to be played 12 seconds into the clip, the timestamp in the Block would be set to 2 seconds.
The ReferenceBlock in the BlockGroup is used instead of the basic "P-frame"/"B-frame" description. Instead of simply saying that this Block depends on the Block directly before or directly after, the Timestamp of the necessary Block is used. Because there can be as many ReferenceBlock Elements as necessary for a Block, it allows for some extremely complex referencing.

The Cues Element is used to seek when playing back a file by providing a temporal index for some of the Tracks. It is similar to the SeekHead Element, but is used for seeking to a specific time when playing back the file. It is possible to seek without this element, but it is much more difficult because a Matroska Reader would have to "hunt and peck" through the file to look for the correct timestamp.

The Cues Element **SHOULD** contain at least one CuePoint Element. Each CuePoint Element stores the position of the Cluster that contains the BlockGroup or SimpleBlock Element. The timestamp is stored in the CueTime Element and the location is stored in the CueTrackPositions Element.

The Cues Element is flexible. For instance, the Cues Element can be used to index every single timestamp of every Block or they can be indexed selectively.

```
+-------------------------------------+
| Cues | CuePoint | CueTime           |
|      |          |-------------------|
|      |          | CueTrackPositions |
|      |------------------------------|
|      | CuePoint | CueTime           |
|      |          |-------------------|
|      |          | CueTrackPositions |
+-------------------------------------+
```

*Figure 8: Representation of a Cues Element and Two Levels of Its Descendant Elements*

The Attachments Element is for attaching files to a Matroska file, such as pictures, fonts, web pages, etc.
The Tags Element contains metadata that describes the Segment and potentially its Tracks, Chapters, and Attachments. Each Track or Chapter that those tags applies to has its UID listed in the Tags. The Tags contain all extra information about the file: scriptwriters, singers, actors, directors, titles, edition, price, dates, genre, comments, etc. Tags can contain their values in multiple languages. For example, a movie's "title" Tag might contain both the original English title as well as the German title.

![Diagram of Attachments Element]

**Figure 9: Representation of an Attachments Element**

The Tags Element contains metadata that describes the Segment and potentially its Tracks, Chapters, and Attachments. Each Track or Chapter that those tags applies to has its UID listed in the Tags. The Tags contain all extra information about the file: scriptwriters, singers, actors, directors, titles, edition, price, dates, genre, comments, etc. Tags can contain their values in multiple languages. For example, a movie's "title" Tag might contain both the original English title as well as the German title.
Figure 10: Representation of a Tags Element and Three Levels of Its Children Elements

5. Matroska Schema

This specification includes an EBML Schema that defines the Elements and structure of Matroska using the EBML Schema elements and attributes defined in Section 11.1 of [RFC8794]. The EBML Schema defines every valid Matroska element in a manner defined by the EBML specification.

Attributes using their default value, such as minOccurs, minver, etc., or attributes with undefined values, such as length, maxver, etc., are omitted.

The definitions of each Matroska Element is provided below.

5.1. Segment Element

id / type: 0x18538067 / master
unknownsizeallowed: True
path: \
Segment
minOccurs / maxOccurs: 1 / 1
definition: The Root Element that contains all other Top-Level Elements; see Section 4.5.

5.1.1. SeekHead Element
id / type: 0x114D9B74 / master
path: \Segment\SeekHead
maxOccurs: 2
definition: Contains seeking information of Top-Level Elements; see Section 4.5.

### 5.1.1. Seek Element

id / type: 0x4DBB / master
path: \Segment\SeekHead\Seek
minOccurs: 1
definition: Contains a single seek entry to an EBML Element.

#### 5.1.1.1. SeekID Element

id / type: 0x53AB / binary
length: 4
path: \Segment\SeekHead\Seek\SeekID
minOccurs / maxOccurs: 1 / 1
definition: The binary EBML ID of a Top-Level Element.

#### 5.1.1.2. SeekPosition Element

id / type: 0x53AC / uinteger
path: \Segment\SeekHead\Seek\SeekPosition
minOccurs / maxOccurs: 1 / 1
definition: The Segment Position (Section 16) of a Top-Level Element.

### 5.1.2. Info Element

id / type: 0x1549A966 / master
path: \Segment\Info
minOccurs / maxOccurs: 1 / 1
recurring: True
definition: Contains general information about the Segment.

#### 5.1.2.1. SegmentUUID Element

id / type: 0x73A4 / binary
length: 16
path: \Segment\Info\SegmentUUID
maxOccurs: 1
definition: A randomly generated UID that identifies the Segment amongst many others (128 bits). It is equivalent to a Universally Unique Identifier (UUID) v4 [RFC4122] with all bits randomly (or pseudorandomly) chosen. An actual UUID v4 value, where some bits are not random, MAY also be used.
usage notes: If the Segment is a part of a Linked Segment, then this Element is REQUIRED. The value of the UID MUST contain at least one bit set to 1.

5.1.2.2. SegmentFilename Element

id / type: 0x7384 / utf-8
path: \Segment\Info\SegmentFilename
maxOccurs: 1
definition: A filename corresponding to this Segment.

5.1.2.3. PrevUUID Element

id / type: 0x3CB923 / binary
length: 16
path: \Segment\Info\PrevUUID
maxOccurs: 1
definition: An ID used that identifies the previous Segment of a Linked Segment.
usage notes: If the Segment is a part of a Linked Segment that uses Hard Linking (Section 17.1), then either the PrevUUID or the NextUUID Element is REQUIRED. If a Segment contains a PrevUUID, but not a NextUUID, then it MAY be considered as the last Segment of the Linked Segment. The PrevUUID MUST NOT be equal to the SegmentUUID.

5.1.2.4. PrevFilename Element

id / type: 0x3C83AB / utf-8
path: \Segment\Info\PrevFilename
maxOccurs: 1
definition: A filename corresponding to the file of the previous Linked Segment.
usage notes: Provision of the previous filename is for display convenience, but PrevUUID SHOULD be considered authoritative for identifying the previous Segment in a Linked Segment.

5.1.2.5. NextUUID Element

id / type: 0x3EB923 / binary
length: 16
path: \Segment\Info\NextUUID
maxOccurs: 1
definition: An ID that identifies the next Segment of a Linked Segment.
usage notes: If the Segment is a part of a Linked Segment that uses Hard Linking (Section 17.1), then either the PrevUUID or the NextUUID Element is REQUIRED. If a Segment contains a NextUUID, but not a PrevUUID, then it MAY be considered as the first Segment of the Linked Segment. The NextUUID MUST NOT be equal to the SegmentUUID.

5.1.2.6. NextFilename Element
SegmentFamily Element

- **id / type:** 0x4444 / binary
- **length:** 16
- **path:** \Segment\Info\SegmentFamily
- **definition:** A UID that all Segments of a Linked Segment **MUST** share (128 bits). It is equivalent to a UUID v4 [RFC4122] with all bits randomly (or pseudo-randomly) chosen. An actual UUID v4 value, where some bits are not random, **MAY** also be used.
- **usage notes:** If the Segment Info contains a ChapterTranslate element, this Element is **REQUIRED**.

ChapterTranslate Element

- **id / type:** 0x6924 / master
- **path:** \Segment\Info\ChapterTranslate
- **definition:** The mapping between this Segment and a Segment value in the given Chapter Codec.
- **rationale:** Chapter Codec may need to address different Segments, but they may not know of the way to identify such Segment when stored in Matroska. This element and its child elements add a way to map the internal Segments known to the Chapter Codec to the Segment IDs in Matroska. This allows remuxing a file with Chapter Codec without changing the content of the codec data and just the Segment mapping.

ChapterTranslateID Element

- **id / type:** 0x69A5 / binary
- **path:** \Segment\Info\ChapterTranslate\ChapterTranslateID
- **minOccurs / maxOccurs:** 1 / 1
- **definition:** The binary value used to represent this Segment in the chapter codec data. The format depends on the ChapProcessCodecID used; see Section 5.1.7.1.4.15.

ChapterTranslateCodec Element

- **id / type:** 0x69BF / uinteger
- **path:** \Segment\Info\ChapterTranslate\ChapterTranslateCodec
- **minOccurs / maxOccurs:** 1 / 1
- **definition:** This ChapterTranslate applies to this chapter codec of the given chapter edition(s); see Section 5.1.7.1.4.15.
defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Matroska Script</td>
<td>Chapter commands using the Matroska Script codec.</td>
</tr>
<tr>
<td>1</td>
<td>DVD-menu</td>
<td>Chapter commands using the DVD-like codec.</td>

</tbody>
</table>

Table 1: ChapterTranslateCodec Values

5.1.2.8.3. ChapterTranslateEditionUID Element

id / type: 0x69FC / uinteger
path: \Segment\Info\ChapterTranslate\ChapterTranslateEditionUID
definition: Specify a chapter edition UID on which this ChapterTranslate applies.
usage notes: When no ChapterTranslateEditionUID is specified in the ChapterTranslate, the
ChapterTranslate applies to all chapter editions found in the Segment using the given
ChapterTranslateCodec.

5.1.2.9. TimestampScale Element

id / type / default: 0x2AD7B1 / uinteger / 1000000
range: not 0
path: \Segment\Info\TimestampScale
minOccurs / maxOccurs: 1 / 1
definition: Base unit for Segment Ticks and Track Ticks in nanoseconds. A TimestampScale
value of 1000000 means scaled timestamps in the Segment are expressed in milliseconds; see
Section 11 on how to interpret timestamps.

5.1.2.10. Duration Element

id / type: 0x4489 / float
range: > 0x0p+0
path: \Segment\Info\Duration
maxOccurs: 1
definition: Duration of the Segment expressed in Segment Ticks, which are based on
TimestampScale; see Section 11.1.

5.1.2.11. DateUTC Element

id / type: 0x4461 / date
path: \Segment\Info\DateUTC
maxOccurs: 1
definition: The date and time that the Segment was created by the muxing application or
library.

5.1.2.12. Title Element
5.1.2.13. MuxingApp Element

id / type: 0x4D80 / utf-8
path: \Segment\Info\MuxingApp
minOccurs / maxOccurs: 1 / 1
definition: Muxing application or library (example: "libmatroska-0.4.3").
usage notes: Include the full name of the application or library followed by the version number.

5.1.2.14. WritingApp Element

id / type: 0x5741 / utf-8
path: \Segment\Info\WritingApp
minOccurs / maxOccurs: 1 / 1
definition: Writing application (example: "mkvmerge-0.3.3").
usage notes: Include the full name of the application followed by the version number.

5.1.3. Cluster Element

id / type: 0x1F43B675 / master
unknownsizeallowed: True
path: \Segment\Cluster
definition: The Top-Level Element containing the (monolithic) Block structure.

5.1.3.1. Timestamp Element

id / type: 0xE7 / uinteger
path: \Segment\Cluster\Timestamp
minOccurs / maxOccurs: 1 / 1
definition: Absolute timestamp of the cluster expressed in Segment Ticks, which are based on TimestampScale; see Section 11.1.
usage notes: This element SHOULD be the first child element of the Cluster it belongs to or the second child element if that Cluster contains a CRC-32 element (Section 6.2).

5.1.3.2. Position Element

id / type: 0xA7 / uinteger
path: \Segment\Cluster\Position
maxOccurs: 1
maxver: 4
5.1.3.3. **PrevSize Element**

id / type: 0xAB / integer
path: \Segment\Cluster\PrevSize
maxOccurs: 1
definition: Size of the previous Cluster in octets. Can be useful for backward playing.

5.1.3.4. **SimpleBlock Element**

id / type: 0xA3 / binary
path: \Segment\Cluster\SimpleBlock
minver: 2
definition: Similar to Block, see Section 10.1, but without all the extra information, mostly used to reduced overhead when no extra feature is needed; see Section 10.2 on SimpleBlock Structure.

5.1.3.5. **BlockGroup Element**

id / type: 0xA0 / master
path: \Segment\Cluster\BlockGroup
definition: Basic container of information containing a single Block and information specific to that Block.

5.1.3.5.1. **Block Element**

id / type: 0xA1 / binary
path: \Segment\Cluster\BlockGroup\Block
minOccurs / maxOccurs: 1 / 1
definition: Block containing the actual data to be rendered and a timestamp relative to the Cluster Timestamp; see Section 10.1 on Block Structure.

5.1.3.5.2. **BlockAdditions Element**

id / type: 0x75A1 / master
path: \Segment\Cluster\BlockGroup\BlockAdditions
maxOccurs: 1
definition: Contains additional binary data to complete the main one; see the Codec BlockAdditions section of [MatroskaCodec] for more information. An EBML parser that has no knowledge of the Block structure could still see and use/skip this data.

5.1.3.5.2.1. **BlockMore Element**
5.1.3.5.2.2. BlockAdditional Element

id / type: 0xA5 / binary
path: \Segment\Cluster\BlockGroup\BlockAdditions\BlockMore\BlockAdditional
minOccurs / maxOccurs: 1 / 1
definition: Interpreted by the codec as it wishes (using the BlockAddID).

5.1.3.5.2.3. BlockAddID Element

id / type / default: 0xEE / uinteger / 1
range: not 0
path: \Segment\Cluster\BlockGroup\BlockAdditions\BlockMore\BlockAddID
minOccurs / maxOccurs: 1 / 1
definition: An ID that identifies how to interpret the BlockAdditional data; see Section 4.1.5 of [MatroskaCodec] for more information. A value of 1 indicates that the meaning of the BlockAdditional data is defined by the codec. Any other value indicates the meaning of the BlockAdditional data is found in the BlockAddIDType found in the TrackEntry.
usage notes: Each BlockAddID value MUST be unique between all BlockMore elements found in a BlockAdditions.
usage notes: To keep MaxBlockAdditionID as low as possible, small values SHOULD be used.

5.1.3.5.3. BlockDuration Element

id / type: 0x9B / uinteger
path: \Segment\Cluster\BlockGroup\BlockDuration
minOccurs / maxOccurs: see implementation notes / 1
definition: The duration of the Block expressed in Track Ticks; see Section 11.1. The BlockDuration Element can be useful at the end of a Track to define the duration of the last frame (as there is no subsequent Block available), or when there is a break in a track like there is for subtitle tracks.
notes:

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>minOccurs</td>
<td>BlockDuration MUST be set (minOccurs=1) if the associated TrackEntry stores a DefaultDuration value.</td>
</tr>
<tr>
<td>default</td>
<td>When not written and with no DefaultDuration, the value is assumed to be the difference between the timestamp of this Block and the timestamp of the next Block in “display” order (not coding order).</td>
</tr>
</tbody>
</table>

Table 2: BlockDuration Implementation Notes
5.1.3.5.4. ReferencePriority Element

id / type / default: 0xFA / uinteger / 0
path: Segment\Cluster\BlockGroup\ReferencePriority
minOccurs / maxOccurs: 1 / 1
definition: This frame is referenced and has the specified cache priority. In cache, only a frame of the same or higher priority can replace this frame. A value of f0 means the frame is not referenced.

5.1.3.5.5. ReferenceBlock Element

id / type: 0xFB / integer
path: Segment\Cluster\BlockGroup\ReferenceBlock
definition: A timestamp value, relative to the timestamp of the Block in this BlockGroup, expressed in Track Ticks; see Section 11.1. This is used to reference other frames necessary to decode this frame. The relative value SHOULD correspond to a valid Block that this Block depends on. Historically, Matroska Writers didn’t write the actual Block(s) that this Block depends on; however, they did write some Block(s) in the past.

The value “0” MAY also be used to signify that this Block cannot be decoded on its own, but without knowledge of which Block is necessary. In this case, other ReferenceBlock Elements MUST NOT be found in the same BlockGroup.

If the BlockGroup doesn’t have a ReferenceBlock element, then the Block it contains can be decoded without using any other Block data.

5.1.3.5.6. CodecState Element

id / type: 0xA4 / binary
path: Segment\Cluster\BlockGroup\CodecState
maxOccurs: 1
minver: 2
definition: The new codec state to use. Data interpretation is private to the codec. This information SHOULD always be referenced by a seek entry.

5.1.3.5.7. DiscardPadding Element

id / type: 0x75A2 / integer
path: Segment\Cluster\BlockGroup\DiscardPadding
maxOccurs: 1
minver: 4
definition: Duration of the silent data added to the Block expressed in Matroska Ticks – i.e., in nanoseconds; see Section 11.1 (padding at the end of the Block for positive values and at the beginning of the Block for negative values). The duration of DiscardPadding is not calculated in the duration of the TrackEntry and SHOULD be discarded during playback.
5.1.4. Tracks Element

id / type: 0x1654AE6B / master
path: \Segment\Tracks
maxOccurs: 1
recurring: True
definition: A Top-Level Element of information with many tracks described.

5.1.4.1. TrackEntry Element

id / type: 0xAE / master
path: \Segment\Tracks\TrackEntry
minOccurs: 1
definition: Describes a track with all Elements.

5.1.4.1.1. TrackNumber Element

id / type: 0xD7 / uinteger
range: not 0
path: \Segment\Tracks\TrackEntry\TrackNumber
minOccurs / maxOccurs: 1 / 1
definition: The track number as used in the Block Header.

5.1.4.1.2. TrackUID Element

id / type: 0x73C5 / uinteger
range: not 0
path: \Segment\Tracks\TrackEntry\TrackUID
minOccurs / maxOccurs: 1 / 1
definition: A UID that identifies the Track.
stream copy: True (Section 8)

5.1.4.1.3. TrackType Element

id / type: 0x83 / uinteger
path: \Segment\Tracks\TrackEntry\TrackType
minOccurs / maxOccurs: 1 / 1
definition: The TrackType defines the type of each frame found in the Track. The value SHOULD be stored on 1 octet.

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>contents of each frame</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>video</td>
<td>An image.</td>
</tr>
<tr>
<td>2</td>
<td>audio</td>
<td>Audio samples.</td>
</tr>
</tbody>
</table>
stream copy: True (Section 8)

### 5.1.4.1.4. FlagEnabled Element

id / type / default: 0xB9 / uinteger / 1
range: 0-1
path: Segment\Tracks\TrackEntry\FlagEnabled
minOccurs / maxOccurs: 1 / 1
minver: 2

definition: Set to 1 if the track is usable. It is possible to turn a track that is not usable into a usable track using chapter codecs or control tracks.

### 5.1.4.1.5. FlagDefault Element

id / type / default: 0x88 / uinteger / 1
range: 0-1
path: Segment\Tracks\TrackEntry\FlagDefault
minOccurs / maxOccurs: 1 / 1

definition: Set if the track (audio, video or subs) is eligible for automatic selection by the player; see Section 19 for more details.

### 5.1.4.1.6. FlagForced Element

id / type / default: 0x55AA / uinteger / 0
range: 0-1
path: Segment\Tracks\TrackEntry\FlagForced
minOccurs / maxOccurs: 1 / 1

---

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>contents of each frame</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>complex</td>
<td>A mix of different other TrackType. The codec needs to define how the Matroska Player should interpret such data.</td>
</tr>
<tr>
<td>16</td>
<td>logo</td>
<td>An image to be rendered over the video track(s).</td>
</tr>
<tr>
<td>17</td>
<td>subtitle</td>
<td>Subtitle or closed caption data to be rendered over the video track(s).</td>
</tr>
<tr>
<td>18</td>
<td>buttons</td>
<td>Interactive button(s) to be rendered over the video track(s).</td>
</tr>
<tr>
<td>32</td>
<td>control</td>
<td>Metadata used to control the player of the Matroska Player.</td>
</tr>
<tr>
<td>33</td>
<td>metadata</td>
<td>Timed metadata that can be passed on to the Matroska Player.</td>
</tr>
</tbody>
</table>

Table 3: TrackType Values
definition: Applies only to subtitles. Set if the track is eligible for automatic selection by the player if it matches the user's language preference, even if the user's preferences wouldn't normally enable subtitles with the selected audio track; this can be used for tracks containing only translations of audio in foreign languages or on-screen text. See Section 19 for more details.

5.1.4.1.7. FlagHearingImpaired Element

id / type: 0x55AB / uinteger
range: 0-1
path: \Segment\Tracks\TrackEntry\FlagHearingImpaired
maxOccurs: 1
minver: 4
definition: Set to 1 if and only if the track is suitable for users with hearing impairments.

5.1.4.1.8. FlagVisualImpaired Element

id / type: 0x55AC / uinteger
range: 0-1
path: \Segment\Tracks\TrackEntry\FlagVisualImpaired
maxOccurs: 1
minver: 4
definition: Set to 1 if and only if the track is suitable for users with visual impairments.

5.1.4.1.9. FlagTextDescriptions Element

id / type: 0x55AD / uinteger
range: 0-1
path: \Segment\Tracks\TrackEntry\FlagTextDescriptions
maxOccurs: 1
minver: 4
definition: Set to 1 if and only if the track contains textual descriptions of video content.

5.1.4.1.10. FlagOriginal Element

id / type: 0x55AE / uinteger
range: 0-1
path: \Segment\Tracks\TrackEntry\FlagOriginal
maxOccurs: 1
minver: 4
definition: Set to 1 if and only if the track is in the content's original language.

5.1.4.1.11. FlagCommentary Element

id / type: 0x55AF / uinteger
5.1.4.1.12. FlagLacing Element

id / type / default: 0x9C / integer / 1
range: 0-1
path: \Segment\Tracks\TrackEntry\FlagLacing
minOccurs / maxOccurs: 1 / 1
definition: Set to 1 if the track MAY contain blocks that use lacing. When set to 0, all blocks MUST have their lacing flags set to No lacing; see Section 10.3 on Block Lacing.

5.1.4.1.13. DefaultDuration Element

id / type: 0x23E383 / integer
range: not 0
path: \Segment\Tracks\TrackEntry\DefaultDuration
maxOccurs: 1
definition: Number of nanoseconds per frame expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1 ("frame" in terms of Matroska -- one Element put into a (Simple)Block).
stream copy: True (Section 8)

5.1.4.1.14. DefaultDecodedFieldDuration Element

id / type: 0x234E7A / integer
range: not 0
path: \Segment\Tracks\TrackEntry\DefaultDecodedFieldDuration
maxOccurs: 1
minver: 4
definition: The period between two successive fields at the output of the decoding process expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1. see Section 9 for more information
stream copy: True (Section 8)

5.1.4.1.15. TrackTimestampScale Element

id / type / default: 0x23314F / float / 0x1p+0
range: > 0x0p+0
path: \Segment\Tracks\TrackEntry\TrackTimestampScale
minOccurs / maxOccurs: 1 / 1
maxver: 3
definition: The scale to apply on this track to work at a normal speed in relation with other tracks (mostly used to adjust video speed when the audio length differs).

stream copy: True (Section 8)

5.1.4.1.16. MaxBlockAdditionID Element

id / type / default: 0x55EE / uinteger / 0
path: \Segment\Tracks\TrackEntry\MaxBlockAdditionID
minOccurs / maxOccurs: 1 / 1
definition: The maximum value of BlockAddID (Section 5.1.3.5.2.3). A value 0 means there is no BlockAdditions (Section 5.1.3.5.2) for this track.

5.1.4.1.17. BlockAdditionMapping Element

id / type: 0x41E4 / master
path: \Segment\Tracks\TrackEntry\BlockAdditionMapping
minver: 4
definition: Contains elements that extend the track format by adding content either to each frame, with BlockAddID (Section 5.1.3.5.2.3), or to the track as a whole with BlockAddIDExtraData.

5.1.4.1.17.1. BlockAddIDValue Element

id / type: 0x41F0 / uinteger
range: >=2
path: \Segment\Tracks\TrackEntry\BlockAdditionMapping\BlockAddIDValue
maxOccurs: 1
minver: 4
definition: If the track format extension needs content beside frames, the value refers to the BlockAddID (Section 5.1.3.5.2.3) value being described.

usage notes: To keep MaxBlockAdditionID as low as possible, small values SHOULD be used.

5.1.4.1.17.2. BlockAddIDName Element

id / type: 0x41A4 / string
path: \Segment\Tracks\TrackEntry\BlockAdditionMapping\BlockAddIDName
maxOccurs: 1
minver: 4
definition: A human-friendly name describing the type of BlockAdditional data as defined by the associated Block Additional Mapping.

5.1.4.1.17.3. BlockAddIDType Element

id / type / default: 0x41E7 / uinteger / 0
path: \Segment\Tracks\TrackEntry\BlockAdditionMapping\BlockAddIDType
stores the registered identifier of the Block Additional Mapping to define how the BlockAdditional data should be handled.

usage notes: If BlockAddIDType is 0, BlockAddIDValue and corresponding BlockAddID values MUST be 1.

5.1.4.17.4. BlockAddIDExtraData Element

id / type: 0x41ED / binary
path: \Segment\Tracks\TrackEntry\BlockAdditionMapping\BlockAddIDExtraData
maxOccurs: 1
minver: 4
definition: Extra binary data that the BlockAddIDType can use to interpret the BlockAdditional data. The interpretation of the binary data depends on the BlockAddIDType value and the corresponding Block Additional Mapping.

5.1.4.18. Name Element

id / type: 0x536E / utf-8
path: \Segment\Tracks\TrackEntry\Name
maxOccurs: 1
definition: A human-readable track name.

5.1.4.19. Language Element

id / type / default: 0x22B59C / string / eng
path: \Segment\Tracks\TrackEntry\Language
minOccurs / maxOccurs: 1 / 1
definition: The language of the track in the Matroska languages form; see Section 12 on language codes. This Element MUST be ignored if the LanguageBCP47 Element is used in the same TrackEntry.

5.1.4.20. LanguageBCP47 Element

id / type: 0x22B59D / string
path: \Segment\Tracks\TrackEntry\LanguageBCP47
maxOccurs: 1
minver: 4
definition: The language of the track in the [BCP47] form; see Section 12 on language codes. If this Element is used, then any Language Elements used in the same TrackEntry MUST be ignored.

5.1.4.21. CodecID Element
id / type: 0x86 / string
path: \Segment\Tracks\TrackEntry\CodecID
minOccurs / maxOccurs: 1 / 1
definition: An ID corresponding to the codec; see [MatroskaCodec] for more info.
stream copy: True (Section 8)

5.1.4.1.22. CodecPrivate Element

id / type: 0x63A2 / binary
path: \Segment\Tracks\TrackEntry\CodecPrivate
maxOccurs: 1
definition: Private data only known to the codec.
stream copy: True (Section 8)

5.1.4.1.23. CodecName Element

id / type: 0x258688 / utf-8
path: \Segment\Tracks\TrackEntry\CodecName
maxOccurs: 1
definition: A human-readable string specifying the codec.

5.1.4.1.24. AttachmentLink Element

id / type: 0x7446 / uinteger
range: not 0
path: \Segment\Tracks\TrackEntry\AttachmentLink
maxOccurs: 1
maxver: 3
definition: The UID of an attachment that is used by this codec.
usage notes: The value MUST match the FileUID value of an attachment found in this Segment.

5.1.4.1.25. CodecDelay Element

id / type / default: 0x56AA / uinteger / 0
path: \Segment\Tracks\TrackEntry\CodecDelay
minOccurs / maxOccurs: 1 / 1
minver: 4
definition: The built-in delay for codec expressed in Matroska Ticks – i.e., in nanoseconds; see Section 11.1. It represents the number of codec samples that will be discarded by the decoder during playback. This timestamp value MUST be subtracted from each frame timestamp in order to get the timestamp that will be actually played. The value SHOULD be small so the muxing of tracks with the same actual timestamp are in the same Cluster.
stream copy: True (Section 8)

5.1.4.1.26. SeekPreRoll Element
After a discontinuity, `SeekPreRoll` is the duration of the data that the decoder **MUST** decode before the decoded data is valid and is expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1.

### 5.1.4.1.27. **TrackTranslate Element**

This track applies to this chapter codec of the given chapter edition(s); see Section 5.1.7.1.4.15.

#### 5.1.4.1.27.1. **TrackTranslateTrackID Element**

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Matroska Script</td>
<td>Chapter commands using the Matroska Script codec.</td>
</tr>
<tr>
<td>1</td>
<td>DVD-menu</td>
<td>Chapter commands using the DVD-like codec.</td>
</tr>
</tbody>
</table>

*Table 4: TrackTranslateCodec Values*

### 5.1.4.1.27.2. **TrackTranslateCodec Element**
id / type: 0x66FC / uinteger
path: \Segment\Tracks\TrackEntry\TrackTranslate\TrackTranslateEditionUID
definition: Specifies a chapter-edition UID in which this TrackTranslate applies.
usage notes: When no TrackTranslateEditionUID is specified in the TrackTranslate, the TrackTranslate applies to all chapter editions found in the Segment using the given TrackTranslateCodec.

5.1.4.1.28. Video Element

id / type: 0xE0 / master
path: \Segment\Tracks\TrackEntry\Video
maxOccurs: 1
definition: Video settings.

5.1.4.1.28.1. FlagInterlaced Element

id / type / default: 0x9A / integer / 0
path: \Segment\Tracks\TrackEntry\Video\FlagInterlaced
minOccurs / maxOccurs: 1/1
minver: 2
definition: Specify whether the video frames in this track are interlaced.

defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>undetermined</td>
<td>Unknown status. This value SHOULD be avoided.</td>
</tr>
<tr>
<td>1</td>
<td>interlaced</td>
<td>Interlaced frames.</td>
</tr>
<tr>
<td>2</td>
<td>progressive</td>
<td>No interlacing.</td>
</tr>
</tbody>
</table>

*Table 5: FlagInterlaced Values*

stream copy: True (*Section 8*)

5.1.4.1.28.2. FieldOrder Element

id / type / default: 0x9D / integer / 2
path: \Segment\Tracks\TrackEntry\Video\FieldOrder
minOccurs / maxOccurs: 1/1
minver: 4
definition: Specifies the field ordering of video frames in this track.

defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>progressive</td>
<td>Interlaced frames. This value SHOULD be avoided; setting FlagInterlaced to 2 is sufficient.</td>
</tr>
</tbody>
</table>

### Table 6: FieldOrder Values

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>tff</td>
<td>Top field displayed first. Top field stored first.</td>
</tr>
<tr>
<td>2</td>
<td>undetermined</td>
<td>Unknown field order. This value <strong>SHOULD</strong> be avoided.</td>
</tr>
<tr>
<td>6</td>
<td>bff</td>
<td>Bottom field displayed first. Bottom field stored first.</td>
</tr>
<tr>
<td>9</td>
<td>bff(swapped)</td>
<td>Top field displayed first. Fields are interleaved in storage with the top line of the top field stored first.</td>
</tr>
<tr>
<td>14</td>
<td>tff(swapped)</td>
<td>Bottom field displayed first. Fields are interleaved in storage with the top line of the top field stored first.</td>
</tr>
</tbody>
</table>

Usage notes: If FlagInterlaced is not set to 1, this Element **MUST** be ignored.

Stream Copy: True ([Section 8](#))

#### 5.1.4.1.28.3. StereoMode Element

- **id / type / default:** 0x53B8 / uinteger / 0
- **path:** \Segment\Tracks\TrackEntry\Video\StereoMode
- **minOccurs / maxOccurs:** 1 / 1
- **minver:** 3
- **definition:** Stereo-3D video mode; see [Section 18.10](#) for more details.

**Restrictions:**

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>mono</td>
</tr>
<tr>

<tr>
<td>13</td>
<td>both eyes laced in one Block (left eye is first)</td>
</tr>
<tr>
<td>14</td>
<td>both eyes laced in one Block (right eye is first)</td>
</tr>
</tbody>
</table>

Table 7: StereoMode Values

5.1.4.1.28.4. AlphaMode Element

id / type / default: 0x53C0 / uinteger / 0
path: \Segment\Tracks\TrackEntry\Video\AlphaMode
minOccurs / maxOccurs: 1 / 1
minver: 3
definition: Indicates whether the BlockAdditional Element with BlockAddID of "1" contains Alpha data as defined by to the Codec Mapping for the CodecID. Undefined values SHOULD NOT be used, as the behavior of known implementations is different (considered either as 0 or 1).
defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>none</td>
<td>The BlockAdditional Element with BlockAddID of &quot;1&quot; does not exist or SHOULD NOT be considered as containing such data.</td>
</tr>
<tr>
<td>1</td>
<td>present</td>
<td>The BlockAdditional Element with BlockAddID of &quot;1&quot; contains alpha channel data.</td>
</tr>
</tbody>
</table>

Table 8: AlphaMode Values

5.1.4.1.28.5. OldStereoMode Element

id / type: 0x53B9 / uinteger
path: \Segment\Tracks\TrackEntry\Video\OldStereoMode
maxOccurs: 1
maxver: 2
definition: Bogus StereoMode value used in old versions of libmatroska.
restrictions:
usage notes:  This Element **MUST NOT** be used. It was an incorrect value used in libmatroska up to 0.9.0.

### Table 9: OldStereoMode Values

5.1.4.1.28.6. **PixelWidth Element**

- **id/type:** 0xB0 / uinteger
- **range:** not 0
- **path:** \Segment\Tracks\TrackEntry\Video\PixelWidth
- **minOccurs/maxOccurs:** 1/1
- **definition:** Width of the encoded video frames in pixels.
- **stream copy:** True ([Section 8](#))

5.1.4.1.28.7. **PixelHeight Element**

- **id/type:** 0xBA / uinteger
- **range:** not 0
- **path:** \Segment\Tracks\TrackEntry\Video\PixelHeight
- **minOccurs/maxOccurs:** 1/1
- **definition:** Height of the encoded video frames in pixels.
- **stream copy:** True ([Section 8](#))

5.1.4.1.28.8. **PixelCropBottom Element**

- **id/type/default:** 0x54AA / uinteger / 0
- **path:** \Segment\Tracks\TrackEntry\Video\PixelCropBottom
- **minOccurs/maxOccurs:** 1/1
- **definition:** The number of video pixels to remove at the bottom of the image.
- **stream copy:** True ([Section 8](#))

5.1.4.1.28.9. **PixelCropTop Element**

- **id/type/default:** 0x54BB / uinteger / 0
- **path:** \Segment\Tracks\TrackEntry\Video\PixelCropTop
- **minOccurs/maxOccurs:** 1/1
- **definition:** The number of video pixels to remove at the top of the image.
stream copy:  True (Section 8)

5.1.4.1.28.10. PixelCropLeft Element

id / type / default:  0x54CC / uinteger / 0  
path: \Segment\Tracks\TrackEntry\Video\PixelCropLeft  
minOccurs / maxOccurs:  1 / 1  
definition:  The number of video pixels to remove on the left of the image.  
stream copy:  True (Section 8)

5.1.4.1.28.11. PixelCropRight Element

id / type / default:  0x54DD / uinteger / 0  
path: \Segment\Tracks\TrackEntry\Video\PixelCropRight  
minOccurs / maxOccurs:  1 / 1  
definition:  The number of video pixels to remove on the right of the image.  
stream copy:  True (Section 8)

5.1.4.1.28.12. DisplayWidth Element

id / type:  0x54B0 / uinteger  
range:  not 0  
path: \Segment\Tracks\TrackEntry\Video\DisplayWidth  
maxOccurs:  1  
definition:  Width of the video frames to display. Applies to the video frame after cropping (PixelCrop* Elements).  
notes:  

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>If the DisplayUnit of the same TrackEntry is 0, then the default value for DisplayWidth is equal to PixelWidth - PixelCropLeft - PixelCropRight; otherwise, there is no default value.</td>
</tr>
</tbody>
</table>

Table 10: DisplayWidth Implementation Notes

stream copy:  True (Section 8)

5.1.4.1.28.13. DisplayHeight Element

id / type:  0x54BA / uinteger  
range:  not 0  
path: \Segment\Tracks\TrackEntry\Video\DisplayHeight  
maxOccurs:  1  
definition:  Height of the video frames to display. Applies to the video frame after cropping (PixelCrop* Elements).  
notes:
<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
</table>
| default   | If the DisplayUnit of the same TrackEntry is 0, then the default value for DisplayHeight is equal to PixelHeight - PixelCropTop - PixelCropBottom; otherwise, there is no default value.

Table 11: DisplayHeight Implementation Notes

stream copy: True (Section 8)

5.1.4.1.28.14. DisplayUnit Element

id / type / default: 0x54B2 / uinteger / 0
path: \Segment\Tracks\TrackEntry\Video\DisplayUnit
minOccurs / maxOccurs: 1 / 1
definition: How DisplayWidth and DisplayHeight are interpreted.
restrictions:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>pixels</td>
</tr>
<tr>

5.1.4.1.28.15. UncompressedFourCC Element

id / type: 0x2EB524 / binary
length: 4
path: \Segment\Tracks\TrackEntry\Video\UncompressedFourCC
minOccurs / maxOccurs: see implementation notes / 1
definition: Specifies the uncompressed pixel format used for the Track's data as a FourCC. This value is similar in scope to the biCompression value of AVI's BITMAPINFO [AVIFormat]. There is neither a definitive list of FourCC values nor an official registry. Some common values for YUV pixel formats can be found at [MSYUV8], [MSYUV16], and [FourCC-YUV]. Some common values for uncompressed RGB pixel formats can be found at [MSRGB] and [FourCC-RGB].

notes:
<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>minOccurs UncompressedFourCC MUST be set (minOccurs=1) in the TrackEntry when the CodecID Element of the TrackEntry is set to &quot;V_UNCOMPRESSED&quot;.</td>

stream copy: True (Section 8)

5.1.4.1.28.18. BitsPerChannel Element

id / type / default: 0x55B2 / uinteger / 0
path: \Segment\Tracks\TrackEntry\Video\Colour\BitsPerChannel
minOccurs / maxOccurs: 1 / 1
minver: 4
definition: Number of decoded bits per channel. A value of 0 indicates that the BitsPerChannel is unspecified.
stream copy: True (Section 8)

5.1.4.1.28.19. ChromaSubsamplingHorz Element

id / type: 0x55B3 / uinteger
path: \Segment\Tracks\TrackEntry\Video\Colour\ChromaSubsamplingHorz
maxOccurs: 1
minver: 4
definition: The amount of pixels to remove in the Cr and Cb channels for every pixel not removed horizontally. For example, the ChromaSubsamplingHorz SHOULD be set to 1 for a video with 4:2:0 chroma subsampling.
stream copy: True (Section 8)

5.1.4.1.28.20. ChromaSubsamplingVert Element

id / type: 0x55B4 / uinteger
path: \Segment\Tracks\TrackEntry\Video\Colour\ChromaSubsamplingVert
maxOccurs: 1
minver: 4
definition: The amount of pixels to remove in the Cr and Cb channels for every pixel not removed vertically. For example, the ChromaSubsamplingVert SHOULD be set to 1 for a video with 4:2:0 chroma subsampling.

stream copy: True (Section 8)

5.1.4.1.28.21. CbSubsamplingHorz Element

id / type: 0x55B5 / uinteger
path: \Segment\Tracks\TrackEntry\Video\Colour\CbSubsamplingHorz
maxOccurs: 1
minver: 4
definition: The amount of pixels to remove in the Cb channel for every pixel not removed horizontally. This is additive with ChromaSubsamplingHorz. For example, the ChromaSubsamplingHorz and CbSubsamplingHorz SHOULD be set to 1 for a video with 4:2:1 chroma subsampling.

stream copy: True (Section 8)

5.1.4.1.28.22. CbSubsamplingVert Element

id / type: 0x55B6 / uinteger
path: \Segment\Tracks\TrackEntry\Video\Colour\CbSubsamplingVert
maxOccurs: 1
minver: 4
definition: The amount of pixels to remove in the Cb channel for every pixel not removed vertically. This is additive with ChromaSubsamplingVert.

stream copy: True (Section 8)

| path: | \Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\PrimaryRChromaticityY |
| maxOccurs: | 1 |
| minver: | 4 |
| definition: | Red Y chromaticity coordinate as defined by [CIE-1931]. |
| stream copy: | True (Section 8) |

5.1.4.1.28.33. PrimaryGChromaticityX Element
id / type: 0x55D3 / float
range: 0x0p+0-0x1p+0
path: `Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\PrimaryGChromaticity X`
maxOccurs: 1
minver: 4
definition: Green X chromaticity coordinate as defined by [CIE-1931].
stream copy: True (Section 8)

5.1.4.1.28.34. PrimaryGChromaticityY Element

id / type: 0x55D4 / float
range: 0x0p+0-0x1p+0
path: `Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\PrimaryGChromaticity Y`
maxOccurs: 1
minver: 4
definition: Green Y chromaticity coordinate as defined by [CIE-1931].
stream copy: True (Section 8)

5.1.4.1.28.35. PrimaryBChromaticityX Element

id / type: 0x55D5 / float
range: 0x0p+0-0x1p+0
path: `Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\PrimaryBChromaticity X`
maxOccurs: 1
minver: 4
definition: Blue X chromaticity coordinate as defined by [CIE-1931].
stream copy: True (Section 8)

5.1.4.1.28.36. PrimaryBChromaticityY Element

id / type: 0x55D6 / float
range: 0x0p+0-0x1p+0
path: `Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\PrimaryBChromaticity Y`
maxOccurs: 1
minver: 4
definition: Blue Y chromaticity coordinate as defined by [CIE-1931].
stream copy: True (Section 8)
5.1.4.1.28.37. WhitePointChromaticityX Element

id / type: 0x55D7 / float
range: 0x0p+0-0x1p+0
path: \Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\WhitePointChromaticityX
maxOccurs: 1
minver: 4
definition: White X chromaticity coordinate as defined by [CIE-1931].
stream copy: True (Section 8)

5.1.4.1.28.38. WhitePointChromaticityY Element

id / type: 0x55D8 / float
range: 0x0p+0-0x1p+0
path: \Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\WhitePointChromaticityY
maxOccurs: 1
minver: 4
definition: White Y chromaticity coordinate as defined by [CIE-1931].
stream copy: True (Section 8)

5.1.4.1.28.39. LuminanceMax Element

id / type: 0x55D9 / float
range: >= 0x0p+0
path: \Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\LuminanceMax
maxOccurs: 1
minver: 4
definition: Maximum luminance. Represented in candelas per square meter (cd/m²).
stream copy: True (Section 8)

5.1.4.1.28.40. LuminanceMin Element

id / type: 0x55DA / float
range: >= 0x0p+0
path: \Segment\Tracks\TrackEntry\Video\Colour\MasteringMetadata\LuminanceMin
maxOccurs: 1
minver: 4
definition: Minimum luminance. Represented in candelas per square meter (cd/m²).
stream copy: True (Section 8)
5.1.4.1.28.41. Projection Element

id / type: 0x7670 / master
path: Segment\Tracks\TrackEntry\Video\Projection
maxOccurs: 1
minver: 4
definition: Describes the video projection details. Used to render spherical, VR videos or flipping videos horizontally/vertically.
stream copy: True (Section 8)

5.1.4.1.28.42. ProjectionType Element

id / type / default: 0x7671 / uinteger / 0
path: Segment\Tracks\TrackEntry\Video\Projection\ProjectionType
minOccurs / maxOccurs: 1 / 1
minver: 4
definition: Describes the projection used for this video track.
restrictions:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>rectangular</td>
</tr>
<tr>
<td>1</td>
<td>equirectangular</td>
</tr>
<tr>
<td>2</td>
<td>cubemap</td>
</tr>
<tr>
<td>3</td>
<td>mesh</td>
</tr>
</tbody>
</table>

Table 20: ProjectionType Values

stream copy: True (Section 8)

5.1.4.1.28.43. ProjectionPrivate Element

id / type: 0x7672 / binary
path: Segment\Tracks\TrackEntry\Video\Projection\ProjectionPrivate
maxOccurs: 1
minver: 4
definition: Private data that only applies to a specific projection.

- If ProjectionType equals 0 (rectangular), then this element MUST NOT be present.
- If ProjectionType equals 1 (equirectangular), then this element MUST be present and contain the same binary data that would be stored inside an ISOBMFF Equirectangular Projection Box ("equi").
If ProjectionType equals 2 (cubemap), then this element MUST be present and contain the same binary data that would be stored inside an ISOBMFF Cubemap Projection Box ("cbmp").

If ProjectionType equals 3 (mesh), then this element MUST be present and contain the same binary data that would be stored inside an ISOBMFF Mesh Projection Box ("mshp").

usage notes: ISOBMFF box size and FourCC fields are not included in the binary data, but the FullBox version and flag fields are. This is to avoid redundant framing information while preserving versioning and semantics between the two container formats.

stream copy: True (Section 8)

5.1.4.1.28.44. ProjectionPoseYaw Element

id / type / default: 0x7673 / float / 0x0p+0
range: >= -0xB4p+0, <= 0xB4p+0
path: \Segment\Tracks\TrackEntry\Video\Projection\ProjectionPoseYaw
minOccurs / maxOccurs: 1 / 1
minver: 4
definition: Specifies a yaw rotation to the projection.
stream copy: True (Section 8)

Value represents a clockwise rotation, in degrees, around the up vector. This rotation must be applied before any ProjectionPosePitch or ProjectionPoseRoll rotations. The value of this element MUST be in the -180 to 180 degree range, both included.

Setting ProjectionPoseYaw to -180 or 180 degrees with the ProjectionPoseRoll and ProjectionPosePitch set to 0 degrees flips the image horizontally.

5.1.4.1.28.45. ProjectionPosePitch Element

id / type / default: 0x7674 / float / 0x0p+0
range: >= -0x5Ap+0, <= 0x5Ap+0
path: \Segment\Tracks\TrackEntry\Video\Projection\ProjectionPosePitch
minOccurs / maxOccurs: 1 / 1
minver: 4
definition: Specifies a pitch rotation to the projection.
stream copy: True (Section 8)

Value represents a counter-clockwise rotation, in degrees, around the right vector. This rotation must be applied after the ProjectionPoseYaw rotation and before the ProjectionPoseRoll rotation. The value of this element MUST be in the -90 to 90 degree range, both included.

5.1.4.1.28.46. ProjectionPoseRoll Element

id / type / default: 0x7675 / float / 0x0p+0
range: >= -0xB4p+0, <= 0xB4p+0
Specifies a roll rotation to the projection.

Value represents a counter-clockwise rotation, in degrees, around the forward vector. This rotation must be applied after the ProjectionPoseYaw and ProjectionPosePitch rotations. The value of this element MUST be in the -180 to 180 degree range, both included.

Setting ProjectionPoseRoll to -180 or 180 degrees and ProjectionPoseYaw to 180 or -180 degrees with ProjectionPosePitch set to 0 degrees flips the image vertically.

Setting ProjectionPoseRoll to 180 or -180 degrees with ProjectionPoseYaw and ProjectionPosePitch set to 0 degrees flips the image horizontally and vertically.

5.1.4.1.29. Audio Element

id / type: 0xE1 / master
path: \Segment\Tracks\TrackEntry\Audio
maxOccurs: 1
definition: Audio settings.

5.1.4.1.29.1. SamplingFrequency Element

id / type / default: 0xB5 / float / 0x1.f4p+12
range: > 0x0p+0
path: \Segment\Tracks\TrackEntry\Audio\SamplingFrequency
minOccurs / maxOccurs: 1 / 1
definition: Sampling frequency in Hz.
stream copy: True (Section 8)

5.1.4.1.29.2. OutputSamplingFrequency Element

id / type: 0x78B5 / float
range: > 0x0p+0
path: \Segment\Tracks\TrackEntry\Audio\OutputSamplingFrequency
maxOccurs: 1
definition: Real output sampling frequency in Hz (used for SBR techniques).
notes:

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>The default value for OutputSamplingFrequency of the same TrackEntry is equal to the SamplingFrequency.</td>
</tr>

Table 21: OutputSamplingFrequency Implementation Notes
5.1.4.1.29.3. **Channels Element**

id / type / default: 0x9F / uinteger / 1
range: not 0
path: `Segment\Tracks\TrackEntry\Audio\Channels`
minOccurs / maxOccurs: 1 / 1
definition: Numbers of channels in the track.
stream copy: True ([Section 8](#))

5.1.4.1.29.4. **BitDepth Element**

id / type: 0x6264 / uinteger
range: not 0
path: `Segment\Tracks\TrackEntry\Audio\BitDepth`
maxOccurs: 1
definition: Bits per sample. Mostly used for PCM.
stream copy: True ([Section 8](#))

5.1.4.1.30. **TrackOperation Element**

id / type: 0xE2 / master
path: `Segment\Tracks\TrackEntry\TrackOperation`
maxOccurs: 1
minver: 3
definition: Operation that needs to be applied on tracks to create this virtual track; see [Section 18.8](#) for more details.
stream copy: True ([Section 8](#))

5.1.4.1.30.1. **TrackCombinePlanes Element**

id / type: 0xE3 / master
path: `Segment\Tracks\TrackEntry\TrackOperation\TrackCombinePlanes`
maxOccurs: 1
minver: 3
definition: Contains the list of all video plane tracks that need to be combined to create this 3D track.
stream copy: True ([Section 8](#))

5.1.4.1.30.2. **TrackPlane Element**

id / type: 0xE4 / master
path: `Segment\Tracks\TrackEntry\TrackOperation\TrackCombinePlanes\TrackPlane`
minOccurs: 1
minver: 3
definition: Contains a video plane track that needs to be combined to create this 3D track.
stream copy:  True (Section 8)

5.1.4.1.30.3. TrackPlaneUID Element

id / type:  0xE5 / uinteger  
range:  not 0  
path:  \
\Segment\Tracks\TrackEntry\TrackOperation\TrackCombinePlanes\TrackPlane\TrackPlaneUID  
minOccurs / maxOccurs:  1 / 1  
minver:  3  
definition:  The trackUID number of the track representing the plane.  
stream copy:  True (Section 8)

5.1.4.1.30.4. TrackPlaneType Element

id / type:  0xE6 / uinteger  
path:  \
\Segment\Tracks\TrackEntry\TrackOperation\TrackCombinePlanes\TrackPlane\TrackPlaneType  
minOccurs / maxOccurs:  1 / 1  
minver:  3  
definition:  The kind of plane this track corresponds to.  
restrictions:  

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>left eye</td>
</tr>
<tr>
<td>1</td>
<td>right eye</td>
</tr>
<tr>
<td>2</td>
<td>background</td>
</tr>
</tbody>
</table>

*Table 22: TrackPlaneType Values*

stream copy:  True (Section 8)

5.1.4.1.30.5. TrackJoinBlocks Element

id / type:  0xE9 / master  
path:  \
\Segment\Tracks\TrackEntry\TrackOperation\TrackCombinePlanes\TrackJoinBlocks  
maxOccurs:  1  
minver:  3  
definition:  Contains the list of all tracks whose Blocks need to be combined to create this virtual track.  
stream copy:  True (Section 8)
5.1.4.1.30.6. TrackJoinUID Element

id / type: 0xED / uinteger
range: not 0
path: \Segment\Tracks\TrackEntry\TrackOperation\TrackJoinBlocks\TrackJoinUID
minOccurs: 1
minver: 3
definition: The trackUID number of a track whose blocks are used to create this virtual track.
stream copy: True (Section 8)

5.1.4.1.31. ContentEncodings Element

id / type: 0x6D80 / master
path: \Segment\Tracks\TrackEntry\ContentEncodings
maxOccurs: 1
definition: Settings for several content encoding mechanisms like compression or encryption.
stream copy: True (Section 8)

5.1.4.1.31.1. ContentEncoding Element

id / type: 0x6240 / master
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding
minOccurs: 1
definition: Settings for one content encoding like compression or encryption.
stream copy: True (Section 8)

5.1.4.1.31.2. ContentEncodingOrder Element

id / type / default: 0x5031 / uinteger / 0
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncodingOrder
minOccurs / maxOccurs: 1 / 1
definition: Tell in which order to apply each ContentEncoding of the ContentEncodings. The decoder/demuxer MUST start with the ContentEncoding with the highest ContentEncodingOrder and work its way down to the ContentEncoding with the lowest ContentEncodingOrder. This value MUST be unique over for each ContentEncoding found in the ContentEncodings of this TrackEntry.
stream copy: True (Section 8)

5.1.4.1.31.3. ContentEncodingScope Element

id / type / default: 0x5032 / uinteger / 1
A bit field that describes which Elements have been modified in this way. Values (big-endian) can be OR'ed.

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Block</td>
<td>All frame contents excluding lacing data.</td>
</tr>
<tr>
<td>2</td>
<td>Private</td>
<td>The track's CodecPrivate data.</td>
</tr>
<tr>
<td>4</td>
<td>Next</td>
<td>The next ContentEncoding (next ContentEncodingOrder; either the data inside ContentCompression and/or ContentEncryption). This value SHOULD NOT be used, as it's not supported by players.</td>
</tr>
</tbody>
</table>

Table 23: ContentEncodingScope Values

5.1.4.1.31.4. ContentEncodingType Element

A value describing the kind of transformation that is applied.

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Compression</td>
</tr>
<tr>
<td>1</td>
<td>Encryption</td>
</tr>
</tbody>
</table>

Table 24: ContentEncodingType Values

5.1.4.1.31.5. ContentCompression Element

id / type: 0x5034 / master
definition: Settings describing the compression used. This Element MUST be present if the value of ContentEncodingType is 0 and absent otherwise. Each block MUST be decompressable, even if no previous block is available in order to not prevent seeking.

stream copy: True (Section 8)

5.1.4.1.31.6. ContentCompAlgo Element

id / type / default: 0x4254 / uinteger / 0
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentCompression\ContentCompAlgo
minOccurs / maxOccurs: 1 / 1
definition: The compression algorithm used.
defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>zlib</td>
<td>zlib compression [RFC1950]</td>
</tr>
<tr>
<td>1</td>
<td>bzlib</td>
<td>bzip2 compression [BZIP2], SHOULD NOT be used; see usage notes.</td>
</tr>
<tr>
<td>2</td>
<td>lzo1x</td>
<td>Lempel-Ziv-Oberhumer compression [LZO], SHOULD NOT be used; see usage notes.</td>
</tr>
<tr>
<td>3</td>
<td>Header Stripping</td>
<td>Octets in ContentCompSettings (Section 5.1.4.1.31.7) have been stripped from each frame.</td>
</tr>
</tbody>
</table>

Table 25: ContentCompAlgo Values

usage notes: Compression method “1” (bzlib) and “2” (lzo1x) are lacking proper documentation on the format, which limits implementation possibilities. Due to licensing conflicts on commonly available libraries compression methods, “2” (lzo1x) does not offer widespread interoperability. A Matroska Writer SHOULD NOT use these compression methods by default. A Matroska Reader MAY support methods “1” and “2” if possible and SHOULD support other methods.

stream copy: True (Section 8)

5.1.4.1.31.7. ContentCompSettings Element

id / type: 0x4255 / binary
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentCompression\ContentCompSettings
maxOccurs: 1
definition: Settings that might be needed by the decompressor. For Header Stripping (ContentCompAlgo=3), the bytes that were removed from the beginning of each frames of the track.
stream copy: True (Section 8)

5.1.4.1.31.8. ContentEncryption Element

id / type: 0x5035 / master
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption
maxOccurs: 1
definition: Settings describing the encryption used. This Element **MUST** be present if the value of ContentEncodingType is 1 (encryption) and **MUST** be ignored otherwise. A Matroska Player **MAY** support encryption.
stream copy: True (Section 8)

5.1.4.1.31.9. ContentEncAlgo Element

id / type / default: 0x47E1 / uinteger / 0
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentEncAlgo
minOccurs / maxOccurs: 1 / 1
definition: The encryption algorithm used.
defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Not encrypted</td>
<td>The data is not encrypted.</td>
</tr>
<tr>
<td>1</td>
<td>DES</td>
<td>Data Encryption Standard (DES) [FIPS46-3]. This value <strong>SHOULD</strong> be avoided.</td>
</tr>
<tr>
<td>2</td>
<td>3DES</td>
<td>Triple Data Encryption Algorithm [SP800-67]. This value <strong>SHOULD</strong> be avoided.</td>
</tr>
<tr>
<td>3</td>
<td>Twofish</td>
<td>Twofish Encryption Algorithm [Twofish].</td>
</tr>
<tr>
<td>4</td>
<td>Blowfish</td>
<td>Blowfish Encryption Algorithm [Blowfish]. This value <strong>SHOULD</strong> be avoided.</td>
</tr>
<tr>
<td>5</td>
<td>AES</td>
<td>Advanced Encryption Standard (AES) [FIPS197].</td>
</tr>
</tbody>
</table>

*Table 26: ContentEncAlgo Values*

stream copy: True (Section 8)

5.1.4.1.31.10. ContentEncKeyID Element

id / type: 0x47E2 / binary
path:
  \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentEncKeyID
maxOccurs: 1
definition: The ID of the public key that the data was encrypted with for public key algorithms.
stream copy: True (Section 8)

5.1.4.1.31.11. ContentEncAESSettings Element

id / type: 0x47E7 / master
path:
  \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentEncAESSettings
maxOccurs: 1
minver: 4
definition: Settings describing the encryption algorithm used.
notes:

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxOccurs</td>
<td>ContentEncAESSettings MUST NOT be set (maxOccurs=0) if ContentEncAlgo is not AES (5).</td>
</tr>
</tbody>
</table>

*Table 27: ContentEncAESSettings Implementation Notes*

stream copy: True (Section 8)

5.1.4.1.31.12. AESSettingsCipherMode Element

id / type: 0x47E8 / uinteger
path:
  \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentEncAESSettings\AESSettingsCipherMode
minOccurs / maxOccurs: 1 / 1
minver: 4
definition: The AES cipher mode used in the encryption.
defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>AES-CTR</td>
<td>Counter [SP800-38A].</td>
</tr>
<tr>
<td>2</td>
<td>AES-CBC</td>
<td>Cipher Block Chaining [SP800-38A].</td>
</tr>
</tbody>
</table>

*Table 28: AESSettingsCipherMode Values*
AESSettingsCipherMode MUST NOT be set (maxOccurs=0) if ContentEncAlgo is not AES (5).

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxOccurs</td>
<td>AESSettingsCipherMode MUST NOT be set (maxOccurs=0) if ContentEncAlgo is not AES (5).</td>
</tr>
</tbody>
</table>

Table 29: AESSettingsCipherMode Implementation Notes

stream copy: True (Section 8)

5.1.5. Cues Element

id / type: 0x1C53BB6B / master
path: \Segment\Cues
minOccurs / maxOccurs: see implementation notes / 1
definition: A Top-Level Element to speed seeking access. All entries are local to the Segment.

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>minOccurs</td>
<td>This Element SHOULD be set when the Segment is not transmitted as a live stream; see Section 23.2.</td>
</tr>
</tbody>
</table>

Table 30: Cues Implementation Notes

5.1.5.1. CuePoint Element

id / type: 0xBB / master
path: \Segment\Cues\CuePoint
minOccurs: 1
definition: Contains all information relative to a seek point in the Segment.

5.1.5.1.1. CueTime Element

id / type: 0xB3 / uinteger
path: \Segment\Cues\CuePoint\CueTime
minOccurs / maxOccurs: 1 / 1
definition: Absolute timestamp of the seek point expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1.

5.1.5.1.2. CueTrackPositions Element

id / type: 0xB7 / master
path: \Segment\Cues\CuePoint\CueTrackPositions
minOccurs: 1
definition: Contains positions for different tracks corresponding to the timestamp.

5.1.5.1.2.1. CueTrack Element
id / type: 0xF7 / uinteger
range: not 0
path: \\Segment\Cues\CuePoint\CueTrackPositions\CueTrack
minOccurs / maxOccurs: 1 / 1
definition: The track for which a position is given.

5.1.5.1.2.2. CueClusterPosition Element

id / type: 0xF1 / uinteger
path: \\Segment\Cues\CuePoint\CueTrackPositions\CueClusterPosition
minOccurs / maxOccurs: 1 / 1
definition: The Segment Position (Section 16) of the Cluster containing the associated Block.

5.1.5.1.2.3. CueRelativePosition Element

id / type: 0xF0 / uinteger
path: \\Segment\Cues\CuePoint\CueTrackPositions\CueRelativePosition
maxOccurs: 1
minver: 4
definition: The relative position inside the Cluster of the referenced SimpleBlock or BlockGroup with 0 being the first possible position for an Element inside that Cluster.

5.1.5.1.2.4. CueDuration Element

id / type: 0xB2 / uinteger
path: \\Segment\Cues\CuePoint\CueTrackPositions\CueDuration
maxOccurs: 1
minver: 4
definition: The duration of the block expressed in Segment Ticks, which are based on TimestampScale; see Section 11.1. If this element is missing, the track’s DefaultDuration does not apply and no duration information is available in terms of the cues.

5.1.5.1.2.5. CueBlockNumber Element

id / type: 0x5378 / uinteger
range: not 0
path: \\Segment\Cues\CuePoint\CueTrackPositions\CueBlockNumber
maxOccurs: 1
definition: Number of the Block in the specified Cluster.

5.1.5.1.2.6. CueCodecState Element

id / type / default: 0xEA / uinteger / 0
path: \\Segment\Cues\CuePoint\CueTrackPositions\CueCodecState
minOccurs / maxOccurs: 1 / 1
minver: 2

definition: The Segment Position (Section 16) of the Codec State corresponding to this Cue Element. 0 means that the data is taken from the initial Track Entry.

5.1.5.1.2.7. **CueReference Element**

id / type: 0xDB / master

path: \Segment\Cues\CuePoint\CueTrackPositions\CueReference

minver: 2

definition: The Clusters containing the referenced Blocks.

5.1.5.1.2.8. **CueRefTime Element**

id / type: 0x96 / uinteger

path: \Segment\Cues\CuePoint\CueTrackPositions\CueReference\CueRefTime

minOccurs / maxOccurs: 1 / 1

minver: 2

definition: Timestamp of the referenced Block expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1.

5.1.6. **Attachments Element**

id / type: 0x1941A469 / master

path: \Segment\Attachments

maxOccurs: 1

definition: Contains attached files.

5.1.6.1. **AttachedFile Element**

id / type: 0x61A7 / master

path: \Segment\Attachments\AttachedFile

minOccurs: 1

definition: An attached file.

5.1.6.1.1. **FileDescription Element**

id / type: 0x467E / utf-8

path: \Segment\Attachments\AttachedFile\FileDescription

maxOccurs: 1

5.1.6.1.2. **FileName Element**

id / type: 0x466E / utf-8

path: \Segment\Attachments\AttachedFile\FileName
minOccurs / maxOccurs:  1 / 1
definition:    Filename of the attached file.

5.1.6.1.3.  FileMediaTypeId Element

id / type:  0x4660 / string
path:  \\Segment\Attachments\AttachedFile\FileMediaType
minOccurs / maxOccurs:  1 / 1
definition:    Media type of the file following the format described in [RFC6838].
stream copy:  True (Section 8)

5.1.6.1.4.  FileData Element

id / type:  0x465C / binary
path:  \\Segment\Attachments\AttachedFile\FileData
minOccurs / maxOccurs:  1 / 1
definition:    The data of the file.
stream copy:  True (Section 8)

5.1.6.1.5.  FileUID Element

id / type:  0x46AE / uinteger
range:  not 0
path:  \\Segment\Attachments\AttachedFile\FileUID
minOccurs / maxOccurs:  1 / 1
definition:    UID representing the file, as random as possible.
stream copy:  True (Section 8)

5.1.7.  Chapters Element

id / type:  0x1043A770 / master
path:  \Segment\Chapters
maxOccurs:  1
recurring:  True
definition:    A system to define basic menus and partition data. For more detailed information,
see Section 20.

5.1.7.1.  EditionEntry Element

id / type:  0x45B9 / master
path:  \Segment\Chapters\EditionEntry
minOccurs:  1
definition:    Contains all information about a Segment edition.

5.1.7.1.1.  EditionUID Element
id / type: 0x45BC / uinteger
range: not 0
path: \Segment\Chapters\EditionEntry\EditionUID
maxOccurs: 1
stream copy: True (Section 8)

5.1.7.1.2. EditionFlagDefault Element

id / type / default: 0x45DB / uinteger / 0
range: 0-1
path: \Segment\Chapters\EditionEntry\EditionFlagDefault
minOccurs / maxOccurs: 1 / 1
definition: Set to 1 if the edition SHOULD be used as the default one.

5.1.7.1.3. EditionFlagOrdered Element

id / type / default: 0x45DD / uinteger / 0
range: 0-1
path: \Segment\Chapters\EditionEntry\EditionFlagOrdered
minOccurs / maxOccurs: 1 / 1
definition: Set to 1 if the chapters can be defined multiple times and the order to play them is enforced; see Section 20.1.3.

5.1.7.1.4. ChapterAtom Element

id / type: 0xB6 / master
path: \Segment\Chapters\EditionEntry\+ChapterAtom
minOccurs: 1
recursive: True
definition: Contains the atom information to use as the chapter atom (applies to all tracks).

5.1.7.1.4.1. ChapterUID Element

id / type: 0x73C4 / uinteger
range: not 0
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterUID
minOccurs / maxOccurs: 1 / 1
definition: A UID to identify the Chapter.
stream copy: True (Section 8)

5.1.7.1.4.2. ChapterStringUID Element

id / type: 0x5654 / utf-8
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterStringUID
maxOccurs: 1
minver: 3
definition: A unique string ID to identify the Chapter. For example, it is used as the storage for [WebVTT] cue identifier values.

5.1.7.1.4.3. ChapterTimeStart Element

id / type: 0x91 / uinteger
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterTimeStart
minOccurs / maxOccurs: 1 / 1
definition: Timestamp of the start of Chapter expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1.

5.1.7.1.4.4. ChapterTimeEnd Element

id / type: 0x92 / uinteger
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterTimeEnd
minOccurs / maxOccurs: see implementation notes / 1
definition: Timestamp of the end of Chapter timestamp excluded expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1. The value MUST be greater than or equal to the ChapterTimeStart of the same ChapterAtom.
usage notes: With the ChapterTimeEnd timestamp value being excluded, it MUST take into account the duration of the last frame it includes, especially for the ChapterAtom using the last frames of the Segment.

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>minOccurs</td>
<td>ChapterTimeEnd MUST be set (minOccurs=1) if the Edition is an ordered edition; see Section 20.1.3. If it’s a Parent Chapter, see Section 20.2.3</td>
</tr>
</tbody>
</table>

Table 31: ChapterTimeEnd Implementation Notes

5.1.7.1.4.5. ChapterFlagHidden Element

id / type / default: 0x98 / uinteger / 0
range: 0-1
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterFlagHidden
minOccurs / maxOccurs: 1 / 1
definition: Set to 1 if a chapter is hidden. Hidden chapters SHOULD NOT be available to the user interface (but still to Control Tracks; see Section 20.2.5 on Chapter flags).

5.1.7.1.4.6. ChapterSegmentUUID Element

id / type: 0x6E67 / binary
length: 16
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterSegmentUUID
minOccurs / maxOccurs: see implementation notes / 1

definition: The SegmentUUID of another Segment to play during this chapter.

usage notes: The value MUST NOT be the SegmentUUID value of the Segment it belongs to.

notes:

<table>
<thead>
<tr>
<th>attribute</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>minOccurs</td>
<td>ChapterSegmentUUID MUST be set (minOccurs=1) if ChapterSegmentEditionUID is used; see Section 17.2 on Medium-Linking Segments.</td>
</tr>
</tbody>
</table>

Table 32: ChapterSegmentUUID Implementation Notes

5.1.7.1.4.7. ChapterSegmentEditionUID Element

id / type: 0x6EBC / uinteger
range: not 0
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterSegmentEditionUID
maxOccurs: 1

definition: The EditionUID to play from the Segment linked in ChapterSegmentUUID. If ChapterSegmentEditionUID is undeclared, then no Edition of the linked Segment is used; see Section 17.2 on Medium-Linking Segments.

5.1.7.1.4.8. ChapterPhysicalEquiv Element

id / type: 0x63C3 / uinteger
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterPhysicalEquiv
maxOccurs: 1

definition: Specifies the physical equivalent of this ChapterAtom as "DVD" (60) or "SIDE" (50); see Section 20.4 for a complete list of values.

5.1.7.1.4.9. ChapterDisplay Element

id / type: 0x80 / master
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterDisplay

definition: Contains all possible strings to use for the chapter display.

5.1.7.1.4.10. ChapString Element

id / type: 0x85 / utf-8
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapterDisplay\ ChapString
minOccurs / maxOccurs: 1 / 1

definition: Contains the string to use as the chapter atom.

5.1.7.1.4.11. ChapLanguage Element

id / type / default: 0x437C / string / eng
path: "Segment\Chapters\EditionEntry\+ChapterAtom\ChapterDisplay\ChapLanguage"
mminOccurs: 1
definition: A language corresponding to the string in the Matroska languages form; see Section 12 on language codes. This Element MUST be ignored if a ChapLanguageBCP47 Element is used within the same ChapterDisplay Element.

5.1.7.1.4.12. ChapLanguageBCP47 Element

id / type: 0x437D / string
path: "Segment\Chapters\EditionEntry\+ChapterAtom\ChapterDisplay\ChapLanguageBCP47"
mminver: 4
definition: A language corresponding to the ChapString in the [BCP47] form; see Section 12 on language codes. If a ChapLanguageBCP47 Element is used, then any ChapLanguage and ChapCountry Elements used in the same ChapterDisplay MUST be ignored.

5.1.7.1.4.13. ChapCountry Element

id / type: 0x437E / string
path: "Segment\Chapters\EditionEntry\+ChapterAtom\ChapterDisplay\ChapCountry"
definition: A country corresponding to the string in the Matroska countries form; see Section 13. This Element MUST be ignored if a ChapLanguageBCP47 Element is used within the same ChapterDisplay Element.

5.1.7.1.4.14. ChapProcess Element

id / type: 0x6944 / master
path: "Segment\Chapters\EditionEntry\+ChapterAtom\ChapProcess"
definition: Contains all the commands associated to the Atom.

5.1.7.1.4.15. ChapProcessCodecID Element

id / type / default: 0x6955 / uinteger / 0
path: "Segment\Chapters\EditionEntry\+ChapterAtom\ChapProcess\ChapProcessCodecID"
mminOccurs / maxOccurs: 1 / 1
definition: Contains the type of the codec used for processing. A value of 0 means built-in Matroska processing (to be defined) and a value of 1 means the DVD command set is used; see Section 20.3. More codec IDs can be added later.

5.1.7.1.4.16. ChapProcessPrivate Element

id / type: 0x450D / binary
path: "Segment\Chapters\EditionEntry\+ChapterAtom\ChapProcess\ChapProcessPrivate"
mmaxOccurs: 1
Optional data attached to the ChapProcessCodecID information. For ChapProcessCodecID=1, it is the "DVD level" equivalent; see Section 20.3.

5.1.7.1.4.17. ChapProcessCommand Element

id / type: 0x6911 / master
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapProcess\ChapProcessCommand
definition: Contains all the commands associated with the Atom.

5.1.7.1.4.18. ChapProcessTime Element

id / type: 0x6922 / uinteger
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapProcess\ChapProcessCommand\ChapProcessTime
minOccurs / maxOccurs: 1 / 1
definition: Defines when the process command SHOULD be handled.
restrictions:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>during the whole chapter</td>
</tr>
<tr>
<td>1</td>
<td>before starting playback</td>
</tr>
<tr>
<td>2</td>
<td>after playback of the chapter</td>
</tr>
</tbody>
</table>

Table 33: ChapProcessTime Values

5.1.7.1.4.19. ChapProcessData Element

id / type: 0x6933 / binary
path: \Segment\Chapters\EditionEntry\+ChapterAtom\ChapProcess\ChapProcessCommand\ChapProcessData
minOccurs / maxOccurs: 1 / 1
definition: Contains the command information. The data SHOULD be interpreted depending on the ChapProcessCodecID value. For ChapProcessCodecID = 1, the data corresponds to the binary DVD cell pre/post commands; see Section 20.3.

5.1.8. Tags Element

id / type: 0x1254C367 / master
path: \Segment\Tags
definition: Element containing metadata describing Tracks, Editions, Chapters, Attachments, or Segments as a whole. A list of valid tags can be found in [MatroskaTags].

5.1.8.1. Tag Element
5.1.8.1.1. Targets Element

id / type: 0x63C0 / master
path: Segment\Tags\Tag\Targets
minOccurs / maxOccurs: 1 / 1
definition: Specifies which other elements the metadata represented by the Tag applies to. If this element is empty or omitted, then the Tag describes everything in the Segment.

5.1.8.1.1.1. TargetTypeValue Element

id / type / default: 0x68CA / uinteger / 50
path: Segment\Tags\Tag\Targets\TargetTypeValue
minOccurs / maxOccurs: 1 / 1
definition: A number to indicate the logical level of the target.
defined values:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>70</td>
<td>COLLECTION</td>
<td>The highest hierarchical level that tags can describe.</td>
</tr>
<tr>
<td>60</td>
<td>EDITION / ISSUE / VOLUME / OPUS / SEASON / SEQUEL</td>
<td>A list of lower levels grouped together.</td>
</tr>
<tr>
<td>50</td>
<td>ALBUM / OPERA / CONCERT / MOVIE / EPISODE</td>
<td>The most common grouping level of music and video (equal to an episode for TV series).</td>
</tr>
<tr>
<td>40</td>
<td>PART / SESSION</td>
<td>When an album or episode has different logical parts.</td>
</tr>
<tr>
<td>30</td>
<td>TRACK / SONG / CHAPTER</td>
<td>The common parts of an album or movie.</td>
</tr>
<tr>
<td>20</td>
<td>SUBTRACK / MOVEMENT / SCENE</td>
<td>Corresponds to parts of a track for audio, such as a movement or scene in a movie.</td>
</tr>
<tr>
<td>10</td>
<td>SHOT</td>
<td>The lowest hierarchy found in music or movies.</td>
</tr>
</tbody>
</table>

Table 34: TargetTypeValue Values

5.1.8.1.1.2. TargetType Element

id / type: 0x63CA / string
path: \Segment\Tags\Tag\Targets\TargetType
maxOccurs: 1
definition: An informational string that can be used to display the logical level of the target, such as "ALBUM", "TRACK", "MOVIE", "CHAPTER", etc.
restrictions:

<table>
<thead>
<tr>
<th>value</th>
<th>label</th>
</tr>

*Table 35: TargetType Values*
5.1.8.1.1.3. TagTrackUID Element

id / type / default: 0x63C5 / uinteger / 0
path: \\Segment\Tags\Tag\Targets\TagTrackUID
definition: A UID to identify the Track(s) that the tags belong to.
usage notes: If the value is 0 at this level, the tags apply to all tracks in the Segment. If it is set to any other value, it MUST match the TrackUID value of a track found in this Segment.

5.1.8.1.1.4. TagEditionUID Element

id / type / default: 0x63C9 / uinteger / 0
path: \\Segment\Tags\Tag\Targets\TagEditionUID
definition: A UID to identify the EditionEntry(s) that the tags belong to.
usage notes: If the value is 0 at this level, the tags apply to all editions in the Segment. If it is set to any other value, it MUST match the EditionUID value of an edition found in this Segment.

5.1.8.1.1.5. TagChapterUID Element

id / type / default: 0x63C4 / uinteger / 0
path: \\Segment\Tags\Tag\Targets\TagChapterUID
definition: A UID to identify the Chapter(s) the tags belong to.
usage notes: If the value is 0 at this level, the tags apply to all chapters in the Segment. If it is set to any other value, it MUST match the ChapterUID value of a chapter found in this Segment.

5.1.8.1.1.6. TagAttachmentUID Element

id / type / default: 0x63C6 / uinteger / 0
path: \\Segment\Tags\Tag\Targets\TagAttachmentUID
definition: A UID to identify the Attachment(s) the tags belong to.
usage notes: If the value is 0 at this level, the tags apply to all the attachments in the Segment. If it is set to any other value, it MUST match the FileUID value of an attachment found in this Segment.

5.1.8.1.2. SimpleTag Element

id / type: 0x67C8 / master
path: \\Segment\Tags\Tag\+SimpleTag
minOccurs: 1
recursive: True
definition: Contains general information about the target.

5.1.8.1.2.1. TagName Element

id / type: 0x45A3 / utf-8
path: \\Segment\Tags\Tag\+SimpleTag\TagName
minOccurs / maxOccurs:  1 / 1
definition: The name of the Tag that is going to be stored.

5.1.8.1.2.2. TagLanguage Element

id / type / default: 0x447A / string / und
path: \Segment\Tags\Tag\+SimpleTag\TagLanguage
minOccurs / maxOccurs:  1 / 1
definition: Specifies the language of the specified tag in the Matroska languages form; see Section 12 on language codes. This Element MUST be ignored if the TagLanguageBCP47 Element is used within the same SimpleTag Element.

5.1.8.1.2.3. TagLanguageBCP47 Element

id / type: 0x447B / string
path: \Segment\Tags\Tag\+SimpleTag\TagLanguageBCP47
maxOccurs:  1
minver:  4
definition: The language used in the TagString in the [BCP47] form; see Section 12. If this Element is used, then any TagLanguage Elements used in the same SimpleTag MUST be ignored.

5.1.8.1.2.4. TagDefault Element

id / type / default: 0x4484 / uinteger / 1
range:  0-1
path: \Segment\Tags\Tag\+SimpleTag\TagDefault
minOccurs / maxOccurs:  1 / 1
definition: A boolean value to indicate if this is the default/original language to use for the given tag.

5.1.8.1.2.5. TagString Element

id / type: 0x4487 / utf-8
path: \Segment\Tags\Tag\+SimpleTag\TagString
maxOccurs:  1
definition: The value of the Tag.

5.1.8.1.2.6. TagBinary Element

id / type: 0x4485 / binary
path: \Segment\Tags\Tag\+SimpleTag\TagBinary
maxOccurs:  1
definition: The values of the Tag if it is binary. Note that this cannot be used in the same SimpleTag as TagString.
6. Matroska Element Ordering

With the exceptions of the EBML Header and the CRC-32 Element, the EBML specification does not require any particular storage order for Elements. However, this specification defines, mandates, and recommends the order of certain Elements to facilitate better playback, seeking, and editing efficiency. This section describes and offers rationale for ordering requirements and recommendations for Matroska.

6.1. Top-Level Elements

The Info Element is the only REQUIRED Top-Level Element in a Matroska file. To be playable, Matroska MUST also contain at least one Tracks Element and Cluster Element. The first Info Element and the first Tracks Element MUST either be stored before the first Cluster Element or both SHALL be referenced by a SeekHead Element occurring before the first Cluster Element.

All Top-Level Elements MUST use an EBML Element ID that is 4 octets long.

When using Medium Linking, chapters are used to reference other Segments to play in a given order Section 17.2. A Segment containing these Linked Chapters does not require a Track Element or a Cluster Element.

It is possible to edit a Matroska file after it has been created. For example, chapters, tags, or attachments can be added. When new Top-Level Elements are added to a Matroska file, the SeekHead Element(s) MUST be updated so that the SeekHead Element(s) itemize the identity and position of all Top-Level Elements.

Editing, removing, or adding Elements to a Matroska file often requires that some existing Elements be voided or extended. Transforming the existing Elements into Void Elements as padding can be used as a method to avoid moving large amounts of data around.

6.2. CRC-32

As noted by the EBML specification, if a CRC-32 Element is used, then the CRC-32 Element MUST be the first ordered Element within its Parent Element.

In Matroska, all Top-Level Elements of an EBML Document SHOULD include a CRC-32 Element as their first Child Element. The Segment Element, which is the Root Element, SHOULD NOT have a CRC-32 Element.

6.3. SeekHead

If used, the first SeekHead Element MUST be the first non-CRC-32 Child Element of the Segment Element. If a second SeekHead Element is used, then the first SeekHead Element MUST reference the identity and position of the second SeekHead Element.
Additionally, the second SeekHead Element MUST only reference Cluster Elements and not any other Top-Level Element already contained within the first SeekHead Element.

The second SeekHead Element MAY be stored in any order relative to the other Top-Level Elements. Whether one or two SeekHead Element(s) are used, the SeekHead Element(s) MUST collectively reference the identity and position of all Top-Level Elements except for the first SeekHead Element.

### 6.4. Cues (Index)

The Cues Element is RECOMMENDED to optimize seeking access in Matroska. It is programmatically simpler to add the Cues Element after all Cluster Elements have been written because this does not require a prediction of how much space to reserve before writing the Cluster Elements. However, storing the Cues Element before the Cluster Elements can provide some seeking advantages. If the Cues Element is present, then it SHOULD either be stored before the first Cluster Element or be referenced by a SeekHead Element.

### 6.5. Info

The first Info Element SHOULD occur before the first Tracks Element and first Cluster Element except when it is referenced by a SeekHead Element.

### 6.6. Chapters Element

The Chapters Element SHOULD be placed before the Cluster Element(s). The Chapters Element can be used during playback even if the user does not need to seek. It immediately gives the user information about what section is being read and what other sections are available. In the case of Ordered Chapters, it is RECOMMENDED to evaluate the logical linking even before playing. The Chapters Element SHOULD be placed before the first Tracks Element and after the first Info Element.

### 6.7. Attachments

The Attachments Element is not intended to be used by default when playing the file, but could contain information relevant to the content, such as cover art or fonts. Cover art is useful even before the file is played and fonts could be needed before playback starts for the initialization of subtitles. The Attachments Element MAY be placed before the first Cluster Element; however, if the Attachments Element is likely to be edited, then it SHOULD be placed after the last Cluster Element.

### 6.8. Tags

The Tags Element is most subject to changes after the file was originally created. For easier editing, the Tags Element can be placed at the end of the Segment Element and after the Attachments Element. On the other hand, it is inconvenient to have to seek in the Segment for tags, especially for network streams; thus, it's better if the Tags Element is found early in the
stream. When editing the Tags Element, the original Tags Element at the beginning can be overwritten with a Void Element and a new Tags Element written at the end of the Segment Element. The file and Segment sizes will only marginally change.

7. Matroska Versioning

Matroska is based on the principle that a reading application does not have to support 100% of the specifications in order to be able to play the file. Therefore, a Matroska file contains version indicators that tell a reading application what to expect.

It is possible and valid to have the version fields indicate that the file contains Matroska Elements from a higher specification version number while signaling that a reading application MUST only support a lower version number properly in order to play it back (possibly with a reduced feature set).

The EBML Header of each Matroska document informs the reading application on what version of Matroska to expect. The Elements within the EBML Header with jurisdiction over this information are DocTypeVersion and DocTypeReadVersion.

DocTypeVersion MUST be equal to or greater than the highest Matroska version number of any Element present in the Matroska file. For example, a file using the SimpleBlock Element (Section 5.1.3.4) MUST have a DocTypeVersion equal to or greater than 2. A file containing CueRelativePosition Elements (Section 5.1.5.1.2.3) MUST have a DocTypeVersion equal to or greater than 4.

The DocTypeReadVersion MUST contain the minimum version number that a reading application can minimally support in order to play the file back -- optionally with a reduced feature set. For example, if a file contains only Elements of version 2 or lower except for CueRelativePosition (which is a version 4 Matroska Element), then DocTypeReadVersion SHOULD still be set to 2 and not 4 because evaluating CueRelativePosition is not necessary for standard playback -- it makes seeking more precise if used.

A reading application supporting Matroska version V MUST NOT refuse to read a file with DocReadTypeVersion equal to or lower than V, even if DocTypeVersion is greater than V.

A reading application supporting Matroska version V at minimum and reading a file whose DocTypeReadVersion field is equal to or lower than V MUST skip Matroska / EBML Elements it encounters but does not know about if that unknown element fits into the size constraints set by the current Parent Element.

8. Stream Copy

It is sometimes necessary to create a Matroska file from another Matroska file; e.g., to add subtitles in a language or to edit out a portion of the content. Some values from the original Matroska file need to be kept the same in the destination file. For example, the
Sampling Frequency of an audio track wouldn’t change between the two files. Some other values may change between the two files, such as the TrackNumber of an audio track when another track has been added.

An Element is marked with the property "stream copy: True" when the values of that Element need to be kept identical between the source and destination files. If that property is not set, elements may or may not keep the same value between the source and destination files.

9. **DefaultDecodedFieldDuration**

The DefaultDecodedFieldDuration Element can signal to the displaying application how often fields of a video sequence will be available for displaying. It can be used for both interlaced and progressive content.

If the video sequence is signaled as interlaced Section 5.1.4.1.28.1, then DefaultDecodedFieldDuration equals the period between two successive fields at the output of the decoding process. For video sequences signaled as progressive, DefaultDecodedFieldDuration is half of the period between two successive frames at the output of the decoding process.

These values are valid at the end of the decoding process before post-processing (such as deinterlacing or inverse telecine) is applied.

Examples:

- Blu-ray movie: 1000000000 ns/(48/1.001) = 20854167 ns
- PAL broadcast/DVD: 1000000000 ns/(50/1.000) = 20000000 ns
- N/ATSC broadcast: 1000000000 ns/(60/1.001) = 16683333 ns
- Hard-telecined DVD: 1000000000 ns/(60/1.001) = 16683333 ns (60 encoded interlaced fields per second)
- Soft-telecined DVD: 1000000000 ns/(60/1.001) = 16683333 ns (48 encoded interlaced fields per second, with "repeat_first_field = 1")

10. **Cluster Blocks**

Frames using references SHOULD be stored in "coding order", i.e., storing the references first and then the frames referencing them. A consequence is that timestamps might not be consecutive. However, a frame with a past timestamp MUST reference a frame already known. Otherwise, the frame is considered bad/void.

Matroska has two similar ways to store frames in a block:

- In a Block, which is contained inside a BlockGroup.
- In a SimpleBlock, which is directly in the Cluster.
The `SimpleBlock` is usually preferred unless some extra elements of the `BlockGroup` need to be used. A Matroska Reader **MUST** support both types of blocks.

Each block contains the same parts in the following order:

- A header that is variable in length,
- the lacing information (optional), and
- the consecutive frame(s).

The block header starts with the number of the Track it corresponds to. The value **MUST** correspond to the `TrackNumber` ([Section 5.1.4.1.1](#)) of a `TrackEntry` of the `Segment`.

The `TrackNumber` is coded using the Variable-Size Integer (VINT) mechanism described in [Section 4](#) of [RFC8794](#). To save space, the shortest VINT form **SHOULD** be used. The value can be coded on up to 8 octets. This is the only element with a variable size in the block header.

The timestamp is expressed in Track Ticks; see [Section 11.1](#). The value is stored as a signed value on 16 bits.

### 10.1. Block Structure

This section describes the binary data contained in the `Block` Element ([Section 5.1.3.5.1](#)). Bit 0 is the most significant bit.

As the `TrackNumber` size can vary between 1 and 8 octets, there are 8 different sizes for the `Block` header. The definitions for `TrackNumber` sizes of 1 and 2 are provided; the other variants can be deduced by extending the size of the `TrackNumber` by multiples of 8 bits.

![Figure 11: Block Header with 1 Octet TrackNumber](image)

**Figure 11: Block Header with 1 Octet TrackNumber**
Track Number: 8, 16, 24, 32, 40, 48 or 64 bits. An EBML VINT-coded track number.

Timestamp: 16 bits. Signed timestamp in Track Ticks.

Rsvrd: 4 bits. Reserved bits MUST be set to 0.

INV: 1 bit. Invisible. The codec SHOULD decode this frame but not display it.

LACING: 2 bits. Uses lacing mode.
   - 00b: no lacing (Section 10.3.1)
   - 01b: Xiph lacing (Section 10.3.2)
   - 11b: EBML lacing (Section 10.3.3)
   - 10b: fixed-size lacing (Section 10.3.4)

UNU: 1 bit that is unused.

The following data in the Block corresponds to the lacing data and frames usage as described in each respective lacing mode.

### 10.2. SimpleBlock Structure

This section describes the binary data contained in the SimpleBlock Element (Section 5.1.3.4). Bit 0 is the most significant bit.

The SimpleBlock structure is inspired by the Block structure; see Section 10.1. The main differences are the added Keyframe flag and Discardable flag. Otherwise, everything is the same.

As the TrackNumber size can vary between 1 and 8 octets, there are 8 different sizes for the SimpleBlock header. The definitions for TrackNumber sizes of 1 and 2 are provided; the other variants can be deduced by extending the size of the TrackNumber by multiples of 8 bits.
Track Number: 8, 16, 24, 32, 40, 48 or 64 bits. An EBML VINT-coded track number.

Timestamp: 16 bits. Signed timestamp in Track Ticks.

KEY: 1 bit. Keyframe. Set when the Block contains only keyframes.

Rsvrd: 3 bits. Reserved bits MUST be set to 0.

INV: 1 bit. Invisible. The codec SHOULD decode this frame but not display it

LACING: 2 bits. Uses lacing mode.

- 00b: no lacing (Section 10.3.1)
- 01b: Xiph lacing (Section 10.3.2)
- 11b: EBML lacing (Section 10.3.3)
- 10b: fixed-size lacing (Section 10.3.4)

DIS: 1 bit. Discardable. The frames of the Block can be discarded during playing if needed.

The following data in the SimpleBlock correspond to the lacing data and frames usage as described in each respective lacing mode.
10.3. Block Lacing

Lacing is a mechanism to save space when storing data. It is typically used for small blocks of data (referred to as frames in Matroska). It packs multiple frames into a single Block or SimpleBlock.

Lacing **MUST NOT** be used to store a single frame in a Block or SimpleBlock.

There are 3 types of lacing:

- Xiph, which is inspired by what is found in the Ogg container [RFC3533].
- EBML, which is the same with sizes coded differently.
- Fixed-size, where the size is not coded.

When lacing is not used, i.e., to store a single frame, lacing bits 5 and 6 of the Block or SimpleBlock **MUST** be set to 0.

For example, a user wants to store 3 frames of the same track. The first frame is 800 octets long, the second is 500 octets long, and the third is 1000 octets long. Since these frames are small, they can be stored in a lace to save space.

It is possible to not use lacing at all and just store a single frame without any extra data. When the FlagLacing (Section 5.1.4.1.12) is set to "0", all blocks of that track **MUST NOT** use lacing.

10.3.1. No Lacing

When no lacing is used, the number of frames in the lace is omitted and only one frame can be stored in the Block. Bits 5 and 6 of the Block Header flags are set to 0b00.

The Block for an 800-octet frame is as follows:

<table>
<thead>
<tr>
<th>Block Octets</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4-803</td>
<td>&lt;frame&gt;</td>
<td>Single frame data</td>
</tr>
</tbody>
</table>

*Table 36: No Lacing*

When a Block contains a single frame, it **MUST** use this No lacing mode.

10.3.2. Xiph Lacing

The Xiph lacing uses the same coding of size as found in the Ogg container [RFC3533]. Bits 5 and 6 of the Block Header flags are set to 0b01.

The Block data with laced frames is stored as follows:

- Lacing Head on 1 octet: Number of frames in the lace minus 1.
- Lacing size of each frame except the last one.
- Binary data of each frame consecutively.
The lacing size is split into 255 values, stored as unsigned octets -- for example, 500 is coded 255;245 or [0xFF 0xF5]. A frame with a size multiple of 255 is coded with a 0 at the end of the size -- for example, 765 is coded 255;255;255;0 or [0xFF 0xFF 0xFF 0x00].

The size of the last frame is deduced from the size remaining in the Block after the other frames.

Because large sizes result in large coding of the sizes, it is **RECOMMENDED** to use Xiph lacing only with small frames.

In our example, the 800, 500, and 1000-octet frames are stored with Xiph lacing in a Block as follows:

<table>
<thead>
<tr>
<th>Block Octets</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>0x02</td>
<td>Number of frames minus 1</td>
</tr>
<tr>
<td>5-8</td>
<td>0xFF 0xFF 0xFF 0x23</td>
<td>Size of the first frame (255; 255; 255; 35)</td>
</tr>
<tr>
<td>9-10</td>
<td>0xFF 0xF5</td>
<td>Size of the second frame (255; 245)</td>
</tr>
<tr>
<td>11-810</td>
<td></td>
<td>First frame data</td>
</tr>
<tr>
<td>811-1310</td>
<td></td>
<td>Second frame data</td>
</tr>
<tr>
<td>1311-2310</td>
<td></td>
<td>Third frame data</td>
</tr>
</tbody>
</table>

*Table 37: Xiph Lacing Example*

The Block is 2311 octets and the last frame starts at 1311, so we can deduce that the size of the last frame is 2311 - 1311 = 1000.

**10.3.3. EBML Lacing**

The EBML lacing encodes the frame size with an EBML-like encoding [RFC8794]. Bits 5 and 6 of the Block Header flags are set to 0b11.

The Block data with laced frames is stored as follows:

- Lacing Head on 1 Octet: Number of frames in the lace minus 1.
- Lacing size of each frame except the last one.
- Binary data of each frame consecutively.

The first frame size is encoded as an EBML VINT value. The remaining frame sizes are encoded as signed values using the difference between the frame size and the previous frame size. These signed values are encoded as VINT with a mapping from signed to unsigned numbers. Decoding the unsigned number stored in the VINT to a signed number is done by subtracting $2^{((7\times n)-1)}-1$, where $n$ is the octet size of the VINT.
In our example, the 800, 500 and 1000-octet frames are stored with EBML lacing in a Block as follows:

<table>
<thead>
<tr>
<th>Block Octets</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>0x02</td>
<td>Number of frames minus 1</td>
</tr>
<tr>
<td>5-6</td>
<td>0x43 0x20</td>
<td>Size of the first frame (800 = 0x320 + 0x4000)</td>
</tr>
<tr>
<td>7-8</td>
<td>0x5E 0xD3</td>
<td>Size of the second frame (500 - 800 = -300 = - 0x12C + 0x1FFF + 0x4000)</td>
</tr>
<tr>
<td>8-807</td>
<td>&lt;frame1&gt;</td>
<td>First frame data</td>
</tr>
<tr>
<td>808-1307</td>
<td>&lt;frame2&gt;</td>
<td>Second frame data</td>
</tr>
<tr>
<td>1308-2307</td>
<td>&lt;frame3&gt;</td>
<td>Third frame data</td>
</tr>
</tbody>
</table>

Table 38: EBML Lacing Signed VINT Bits Usage

In our example, the 800, 500 and 1000-octet frames are stored with EBML lacing in a Block as follows:

<table>
<thead>
<tr>
<th>Bit Representation of Signed VINT</th>
<th>Possible Value Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>1xxxx xxxx</td>
<td>$2^7$ values from $-(2^6-1)$ to $2^6$</td>
</tr>
<tr>
<td>01xx xxxx xxxx xxxx</td>
<td>$2^{14}$ values from $-(2^{13}-1)$ to $2^{13}$</td>
</tr>
<tr>
<td>001x xxxx xxxx xxxx xxxx xxxx</td>
<td>$2^{21}$ values from $-(2^{20}-1)$ to $2^{20}$</td>
</tr>
<tr>
<td>0001 xxxx xxxx xxxx xxxx xxxx xxxx</td>
<td>$2^{28}$ values from $-(2^{27}-1)$ to $2^{27}$</td>
</tr>
<tr>
<td>0000 1xxx xxxx xxxx xxxx xxxx xxxx xxxx</td>
<td>$2^{35}$ values from $-(2^{34}-1)$ to $2^{34}$</td>
</tr>
</tbody>
</table>

Table 39: EBML Lacing Example

The Block is 2308 octets and the last frame starts at 1308, so we can deduce that the size of the last frame is 2308 - 1308 = 1000.

### 10.3.4. Fixed-size Lacing

Fixed-size lacing doesn't store the frame size; rather, it only stores the number of frames in the lace. Each frame **MUST** have the same size. The frame size of each frame is deduced from the total size of the Block. Bits 5 and 6 of the Block Header flags are set to \(0b10\).

The Block data with laced frames is stored as follows:

- Lacing Head on 1 Octet: Number of frames in the lace minus 1.
- Binary data of each frame consecutively.
For example, for three frames that are 800 octets each:

<table>
<thead>
<tr>
<th>Block Octets</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>0x02</td>
<td>Number of frames minus 1</td>
</tr>
<tr>
<td>5-804</td>
<td>&lt;frame1&gt;</td>
<td>First frame data</td>
</tr>
<tr>
<td>805-1604</td>
<td>&lt;frame2&gt;</td>
<td>Second frame data</td>
</tr>
<tr>
<td>1605-2404</td>
<td>&lt;frame3&gt;</td>
<td>Third frame data</td>
</tr>
</tbody>
</table>

This gives a Block of 2405 octets. When reading the Block, we find that there are three frames (Octet 4). The data start at Octet 5, so the size of each frame is \((2405 - 5) / 3 = 800\).

### 10.3.5. Laced Frames Timestamp

A Block only contains a single timestamp value. But when lacing is used, it contains more than one frame. Each frame originally has its own timestamp, or Presentation Timestamp (PTS). That timestamp applies to the first frame in the lace.

In the lace, each frame after the first one has an underdetermined timestamp. However, each of these frames **MUST** be contiguous, i.e., the decoded data **MUST NOT** contain any gap between them. If there is a gap in the stream, the frames around the gap **MUST NOT** be in the same Block.

Lacing is only useful for small contiguous data to save space. This is usually the case for audio tracks and not the case for video (which use a lot of data) or subtitle tracks (which have long gaps). For audio, there is usually a fixed output sampling frequency for the whole track, so the decoder should be able to recover the timestamp of each sample knowing each output sample is contiguous with a fixed frequency. For subtitles, this is usually not the case; therefore, lacing **SHOULD NOT** be used.

### 10.4. Random Access Points

Random Access Points (RAPs) are positions where the parser can seek to and start playback without decoding of what was before. In Matroska, BlockGroups and SimpleBlocks can be RAPs. To seek to these elements, it is still necessary to seek to the Cluster containing them, read the Cluster Timestamp, and start playback from the BlockGroup or SimpleBlock that is a RAP.

Because a Matroska File is usually composed of multiple tracks playing at the same time -- video, audio and subtitles -- to seek properly to a RAP, each selected track must be taken in account. Usually, all audio and subtitle BlockGroups or SimpleBlocks are RAPs. They are independent of each other and can be played randomly.
On the other hand, video tracks often use references to previous and future frames for better coding efficiency. Frames with such references MUST either contain one or more ReferenceBlock Elements in their BlockGroup or MUST be marked as non-keyframe in a SimpleBlock; see Section 10.2.

- BlockGroup with a frame that references another frame, with the EBML tree shown as XML:

```xml
<Cluster>
  <Timestamp>123456</Timestamp>
  <BlockGroup>
    <!-- References a Block 40 Track Ticks before this one -->
    <ReferenceBlock>-40</ReferenceBlock>
    <Block/>
  </BlockGroup>
  ...
</Cluster>
```

- SimpleBlock with a frame that references another frame, with the EBML tree shown as XML:

```xml
<Cluster>
  <Timestamp>123456</Timestamp>
  <SimpleBlock/> (octet 3 bit 0 not set)
  ...
</Cluster>
```

Frames that are RAPs (i.e., frames that don't depend on other frames) MUST set the keyframe flag if they are in a SimpleBlock or their parent BlockGroup MUST NOT contain a ReferenceBlock.

- BlockGroup with a frame that references no other frame, with the EBML tree shown as XML:

```xml
<Cluster>
  <Timestamp>123456</Timestamp>
  <BlockGroup>
    <!-- No ReferenceBlock allowed in this BlockGroup -->
    <Block/>
  </BlockGroup>
  ...
</Cluster>
```

- SimpleBlock with a frame that references no other frame, with the EBML tree shown as XML:

```xml
<Cluster>
  <Timestamp>123456</Timestamp>
  <SimpleBlock/> (octet 3 bit 0 set)
  ...
</Cluster>
```
There may be cases where the use of BlockGroup is necessary, as the frame may need a BlockDuration, BlockAdditions, CodecState, or DiscardPadding element. For those cases, a SimpleBlock MUST NOT be used; rather, the reference information SHOULD be recovered for non-RAP frames.

- SimpleBlock with a frame that references another frame, with the EBML tree shown as XML:

```
<Cluster>
  <Timestamp>123456</Timestamp>
  <SimpleBlock/> (octet 3 bit 0 not set)
...
</Cluster>
```

- Same frame that references another frame put inside a BlockGroup to add BlockDuration, with the EBML tree shown as XML:

```
<Cluster>
  <Timestamp>123456</Timestamp>
  <BlockGroup>
    <!-- ReferenceBlock value recovered based on the codec -->
    <ReferenceBlock>-40</ReferenceBlock>
    <BlockDuration>20</BlockDuration>
    <Block/>
  </BlockGroup>
...
</Cluster>
```

When a frame in a BlockGroup is not a RAP, the BlockGroup MUST contain at least a ReferenceBlock. The ReferenceBlocks MUST be used in one of the following ways:

- Each reference frame listed as a ReferenceBlock;
- some referenced frame listed as a ReferenceBlock, even if the timestamp value is accurate; or
- one ReferenceBlock with the timestamp value "0" corresponding to a self or unknown reference.

The lack of ReferenceBlock would mean such a frame is a RAP and seeking on that frame that actually depends on other frames may create a bogus output or even crash.

- Same frame that references another frame put inside a BlockGroup but the reference could not be recovered, with the EBML tree shown as XML:
Intra-only video frames, such as the ones found in AV1 or VP9, can be decoded without any other frame, but they don't reset the codec state. Thus, seeking to these frames is not possible, as the next frames may need frames that are not known from this seeking point. Such intra-only frames **MUST NOT** be considered as keyframes, so the keyframe flag **MUST NOT** be set in the SimpleBlock or a ReferenceBlock **MUST** be used to signify the frame is not a RAP. The timestamp value of the ReferenceBlock **MUST** be "0", meaning it's referencing itself.

- Intra-only frame not an RAP, with the EBML tree shown as XML:

```xml
<Cluster>
  <Timestamp>123456</Timestamp>
  <BlockGroup>
    <!-- References itself to mark it should not be used as RAP -->
    <ReferenceBlock>0</ReferenceBlock>
    <Block/>
  </BlockGroup>
...
</Cluster>
```

Because a video SimpleBlock has less information on references than a video BlockGroup, it is possible to remux a video track using BlockGroup into a SimpleBlock as long as it doesn't use any other BlockGroup features than ReferenceBlock.
11. Timestamps

Historically, timestamps in Matroska were mistakenly called timecodes. The Timestamp Element was called Timecode, the TimestampScale Element was called TimecodeScale, the TrackTimestampScale Element was called TrackTimecodeScale, and the ReferenceTimestamp Element was called ReferenceTimeCode.

11.1. Timestamp Ticks

All timestamp values in Matroska are expressed in multiples of a tick. They are usually stored as integers. There are three types of ticks possible: Matroska Ticks, Segment Ticks, and Track Ticks.

11.1.1. Matroska Ticks

For such elements, the timestamp value is stored directly in nanoseconds.

The elements storing values in Matroska Ticks/nanoseconds are:

- TrackEntry\DefaultDuration; defined in Section 5.1.4.13
- TrackEntry\DefaultDecodedFieldDuration; defined in Section 5.1.4.14
- TrackEntry\SeekPreRoll; defined in Section 5.1.4.126
- TrackEntry\CodecDelay; defined in Section 5.1.4.125
- BlockGroup\DiscardPadding; defined in Section 5.1.3.5.7
- ChapterAtom\ChapterTimeStart; defined in Section 5.1.7.1.4.3
- ChapterAtom\ChapterTimeEnd; defined in Section 5.1.7.1.4.4
- CuePoint\CueTime; defined in Section 5.1.5.1.1
- CueReference\CueRefTime; defined in Section 5.1.5.1.1

11.1.2. Segment Ticks

Elements in Segment Ticks involve the use of the TimestampScale Element of the Segment to get the timestamp in nanoseconds of the element with the following formula:

\[
\text{timestamp in nanosecond} = \text{element value} \times \text{TimestampScale}
\]

This allows for storage of smaller integer values in the elements.

When using the default value of "1,000,000" for TimestampScale, one Segment Tick represents one millisecond.

The elements storing values in Segment Ticks are:

- Cluster\Timestamp; defined in Section 5.1.3.1
- Info\Duration is stored as a floating-point, but the same formula applies; defined in Section 5.1.2.10
11.1.3. Track Ticks

Elements in Track Ticks involve the use of the TimestampScale Element of the Segment and the TrackTimestampScale Element of the Track to get the timestamp in nanoseconds of the element with the following formula:

\[
\text{timestamp in nanoseconds} = \text{element value} \times \text{TrackTimestampScale} \times \text{TimestampScale}
\]

This allows for storage of smaller integer values in the elements. The resulting floating-point values of the timestamps are still expressed in nanoseconds.

When using the default values of "1,000,000" for TimestampScale and "1.0" for TrackTimestampScale, one Track Tick represents one millisecond.

The elements storing values in Track Ticks are:

- Cluster\BlockGroup\Block and Cluster\SimpleBlock timestamps; detailed in Section 11.2
- Cluster\BlockGroup\BlockDuration; defined in Section 5.1.3.5.3
- Cluster\BlockGroup\ReferenceBlock; defined in Section 5.1.3.5.5

When the TrackTimestampScale is interpreted as "1.0", Track Ticks are equivalent to Segment Ticks and give an integer value in nanoseconds. This is the most common case as TrackTimestampScale is usually omitted.

A value of TrackTimestampScale other than 1.0 MAY be used to scale the timestamps more in tune with each Track sampling frequency. For historical reasons, a lot of Matroska readers don't take the TrackTimestampScale value into account; thus, using a value other than 1.0 might not work in many places.

11.2. Block Timestamps

A Block Element and SimpleBlock Element timestamp is the time when the decoded data of the first frame in the Block/SimpleBlock MUST be presented if the track of that Block/SimpleBlock is selected for playback. This is also known as the PTS.

The Block Element and SimpleBlock Element store their timestamps as signed integers, relative to the Cluster\Timestamp value of the Cluster they are stored in. To get the timestamp of a Block or SimpleBlock in nanoseconds, the following formula has to be used:

\[
\left( \text{Cluster}\text{\\Timestamp} + \left( \text{block timestamp} \times \text{TrackTimestampScale} \right) \right) \times \text{TimestampScale}
\]
The Block Element and SimpleBlock Element store their timestamps as 16-bit signed integers, allowing a range from "-32768" to "+32767" Track Ticks. Although these values can be negative, when added to the Cluster\Timestamp, the resulting frame timestamp SHOULD NOT be negative.

When a CodecDelay Element is set, its value MUST be subtracted from each Block timestamp of that track. To get the timestamp in nanoseconds of the first frame in a Block or SimpleBlock, the formula becomes:

\[
\left( \left( \text{Cluster}\Timestamp + \left( \text{block timestamp} \times \text{TrackTimestampScale} \right) \right) \times \text{TimestampScale} \right) - \text{CodecDelay}
\]

The resulting frame timestamp SHOULD NOT be negative.

During playback, when a frame has a negative timestamp, the content MUST be decoded by the decoder, but not played to the user.

**11.3. TimestampScale Rounding**

The default Track Tick duration is one millisecond.

The TimestampScale is a floating-point value that is usually 1.0. When it's not 1.0, the multiplied Block Timestamp is a floating-point value in nanoseconds. The Matroska Reader SHOULD use the nearest rounding value in nanoseconds to get the proper nanosecond timestamp of a Block. This allows some clever TimestampScale values to have a more refined timestamp precision per frame.

**12. Language Codes**

Matroska from version 1 through 3 uses language codes that can be either the 3 letters bibliographic ISO 639-2 form [ISO639-2] (like "fre" for French), or such a language code followed by a dash and a country code for specialities in languages (like "fre-ca" for Canadian French). The ISO 639-2 Language Elements are "Language Element", "TagLanguage Element", and "ChapLanguage Element".

Starting in Matroska version 4, either [ISO639-2] or [BCP47] MAY be used, although BCP 47 is RECOMMENDED. The BCP 47 Language Elements are "LanguageBCP47 Element", "TagLanguageBCP47 Element", and "ChapLanguageBCP47 Element". If a BCP 47 Language Element and an ISO 639-2 Language Element are used within the same Parent Element, then the ISO 639-2 Language Element MUST be ignored; precedence is given to the BCP 47 Language Element.

**13. Country Codes**

Country codes are the [BCP47] two-letter region subtags without the UK exception.
14. Encryption

This Matroska specification provides no interoperable solution for securing the data container with any assurances of confidentiality, integrity, authenticity, or to provide authorization. The ContentEncryption Element (Section 5.1.4.1.31.8) and associated sub-fields (Section 5.1.4.1.31.9 to Section 5.1.4.1.31.12) are defined only for the benefit of implementers to construct their own proprietary solution or as the basis for further standardization activities. How to use these fields to secure a Matroska data container is out of scope, as are any related issues, such as key management and distribution.

A Matroska Reader who encounters containers that use the fields defined in this section MUST rely on out-of-scope guidance to decode the associated content.

Because encryption occurs within the Block Element, it is possible to manipulate encrypted streams without decrypting them. The streams could potentially be copied, deleted, cut, appended, or any number of other possible editing techniques without decryption. The data can be used without having to expose it or go through the decrypting process.

Encryption can also be layered within Matroska. This means that two completely different types of encryption can be used, requiring two separate keys to be able to decrypt a stream.

Encryption information is stored in the ContentEncodings Element under the ContentEncryption Element.

For encryption systems sharing public/private keys, the creation of the keys and the exchange of keys are not covered by this document. They have to be handled by the system using Matroska.

The algorithms described in Table 26 support different modes of operations and key sizes. The specification of these parameters is required for a complete solution, but is out of scope of this document and left to the proprietary implementations using them or subsequent profiles of this document.

The ContentEncodingScope Element gives an idea of which part of the track is encrypted, but each ContentEncAlgo Element and its sub-elements (such as AESSettingsCipherMode) define exactly how the encrypted track should be interpreted.

An example of an extension that builds upon these security-related fields in this specification is [WebM-Enc]. It uses AES-CTR, ContentEncAlgo = 5 (Section 5.1.4.1.31.9), and AESSettingsCipherMode = 1 (Section 5.1.4.1.31.12).

A Matroska Writer MUST NOT use insecure cryptographic algorithms to create new archives or streams, but a Matroska Reader MAY support these algorithms to read previously made archives or streams.
15. Image Presentation

15.1. Cropping

The PixelCrop Elements (PixelCropTop, PixelCropBottom, PixelCropRight, and PixelCropLeft) indicate when, and by how much, encoded video frames SHOULD be cropped for display. These Elements allow edges of the frame that are not intended for display to be stored, but hidden. Examples include the sprockets of a full-frame film scan or the VANC area of a digitized analog videotape. PixelCropTop and PixelCropBottom store an integer of how many rows of pixels SHOULD be cropped from the top and bottom of the image, respectively. PixelCropLeft and PixelCropRight store an integer of how many columns of pixels SHOULD be cropped from the left and right of the image, respectively.

For example, a pillar-boxed video that stores a 1440x1080 visual image within the center of a padded 1920x1080 encoded image may set both PixelCropLeft and PixelCropRight to "240" so that a Matroska Player can crop off 240 columns of pixels from the left and right of the encoded image to present the image with the pillar-boxes hidden.

Cropping has to be performed before resizing and the display dimensions given by DisplayWidth, DisplayHeight, and DisplayUnit apply to the image that is already cropped.

15.2. Rotation

The ProjectionPoseRoll Element (Section 5.1.4.1.28.46) can be used to indicate that the image from the associated video track SHOULD be rotated for presentation. For instance, the following example of the Projection Element (Section 5.1.4.1.28.41) and the ProjectionPoseRoll Element represents a video track where the image SHOULD be presented with a 90-degree counterclockwise rotation, with the EBML tree shown as XML:

```xml
<Projection>
  <ProjectionPoseRoll>90</ProjectionPoseRoll>
</Projection>
```

Figure 15: Rotation Example

16. Segment Position

The Segment Position of an Element refers to the position of the first octet of the Element ID of that Element, measured in octets, from the beginning of the Element Data section of the containing Segment Element. In other words, the Segment Position of an Element is the distance in octets from the beginning of its containing Segment Element minus the size of the Element ID and Element Data Size of that Segment Element. The Segment Position of the first Child Element of the Segment Element is 0. An Element that is not stored within a Segment Element, such as the Elements of the EBML Header, do not have a Segment Position.
16.1. Segment Position Exception

Elements that are defined to store a Segment Position MAY define reserved values to indicate a special meaning.

16.2. Example of Segment Position

This table presents an example of a Segment Position by showing a hexadecimal representation of a very small Matroska file with labels to show the offsets in octets. The file contains a Segment Element with an Element ID of "0x18538067" and a MuxingApp Element with an Element ID of "0x4D80".

|          | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0 |
|          |   |   |   |   |   |   |   |   |   |   | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0 |   |   |   |   |   |   |
|          |   |   |   |   |   |   |   |   |   |   |   |   | 1A | 45 | DF | A3 | 8B | 42 | 82 | 88 | 6D | 61 | 74 | 72 | 6F | 73 | 6B | 61 |
| ^ EBML Header |   |   |   |   |   |   |   |   |   |   |   |   | 18 | 53 | 80 | 67 |   |   |   |   |   |   |   |   |   |   |   |   |
| 0 |   |   |   |   |   |   |   |   |   |   | 20 | 93 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| ^ Segment Data Size |   |   |   |   |   |   |   |   |   |   | 20 | 15 | 49 | A9 | 66 | 8E | 4D | 80 | 84 | 69 | 65 | 74 | 66 | 57 | 41 | 84 | 69 | 65 | 74 | 66 |
| ^ Start of Segment data |   |   |   |   |   |   |   |   |   |   | 20 | 4D | 80 | 84 | 69 | 65 | 74 | 66 | 57 | 41 | 84 | 69 | 65 | 74 | 66 |
| ^ MuxingApp start |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

In the above example, the Element ID of the Segment Element is stored at offset 16, the Element Data Size of the Segment Element is stored at offset 20, and the Element Data of the Segment Element is stored at offset 21.

The MuxingApp Element is stored at offset 26. Since the Segment Position of an Element is calculated by subtracting the position of the Element Data of the containing Segment Element from the position of that Element, the Segment Position of the MuxingApp Element in the above example is "26 - 21" or "5".

17. Linked Segments

Matroska provides several methods to link two or more Segment Elements together to create a Linked Segment. A Linked Segment is a set of multiple Segments linked together into a single presentation by using Hard Linking or Medium Linking.

All Segments within a Linked Segment MUST have a SegmentUUID.

All Segments within a Linked Segment SHOULD be stored within the same directory or be quickly accessible based on their SegmentUUID in order to have a seamless transition between Segments.
All Segments within a Linked Segment MAY set a SegmentFamily with a common value to make it easier for a Matroska Player to know which Segments are meant to be played together.

The SegmentFilename, PrevFilename, and NextFilename elements MAY also give hints on the original filenames that were used when the Segment links were created in case some SegmentUUIDs are damaged.

17.1. Hard Linking

Hard Linking, also called splitting, is the process of creating a Linked Segment by linking multiple Segment Elements using the NextUUID and PrevUUID Elements.

All Segments within a Hard-Linked Segment MUST use the same Tracks list and TimestampScale.

Within a Linked Segment, the timestamps of Block and SimpleBlock MUST consecutively follow the timestamps of Block and SimpleBlock from the previous Segment in linking order.

With Hard Linking, the chapters of any Segment within the Linked Segment MUST only reference the current Segment. The NextUUID and PrevUUID reference the respective SegmentUUID values of the next and previous Segments.

The first Segment of a Linked Segment MUST NOT have a PrevUUID Element. The last Segment of a Linked Segment MUST NOT have a NextUUID Element.

For each node of the chain of Segments of a Linked Segment, at least one Segment MUST reference the other Segment within the chain.

In a chain of Segments of a Linked Segment, the NextUUID always takes precedence over the PrevUUID. If SegmentA has a NextUUID to SegmentB and SegmentB has a PrevUUID to SegmentC, the link to use is NextUUID between SegmentA and SegmentB; SegmentC is not part of the Linked Segment.

If SegmentB has a PrevUUID to SegmentA, but SegmentA has no NextUUID, then the Matroska Player MAY consider these two Segments linked as SegmentA followed by SegmentB.

As an example, three Segments can be Hard Linked as a Linked Segment through cross-referencing each other with SegmentUUID, PrevUUID, and NextUUID as shown in Table 41:

<table>
<thead>
<tr>
<th>file name</th>
<th>SegmentUUID</th>
<th>PrevUUID</th>
<th>NextUUID</th>
</tr>
</thead>
<tbody>
<tr>
<td>start.mkv</td>
<td>71000c23cd310998</td>
<td>Invalid</td>
<td>a77b3598941cb803</td>

</tr>
</tbody>
</table>
17.2. Medium Linking

Medium Linking creates relationships between Segments using Ordered Chapters (Section 20.1.3) and the ChapterSegmentUUID Element. A Chapter Edition with Ordered Chapters MAY contain Chapter elements that reference timestamp ranges from other Segments. The Segment referenced by the Ordered Chapter via the ChapterSegmentUUID Element SHOULD be played as part of a Linked Segment.

The timestamps of Segment content referenced by Ordered Chapters MUST be adjusted according to the cumulative duration of the previous Ordered Chapters.

As an example, a file named intro.mkv could have a SegmentUUID of "0xb16a58609fc7e6065a60c984fc11ead". Another file called program.mkv could use a Chapter Edition that contains two Ordered Chapters. The first chapter references the Segment of intro.mkv with the use of a ChapterSegmentUUID, ChapterSegmentEditionUID, ChapterTimeStart, and an optional ChapterTimeEnd element. The second chapter references content within the Segment of program.mkv. A Matroska Player SHOULD recognize the Linked Segment created by the use of ChapterSegmentUUID in an enabled Edition and present the reference content of the two Segments as a single presentation.

The ChapterSegmentUUID represents the Segment that holds the content to play in place of the Linked Chapter. The ChapterSegmentUUID MUST NOT be the SegmentUUID of its own Segment.

There are two ways to use a chapter link:

- Linked-Duration linking.
- Linked-Edition linking

17.2.1. Linked Duration

A Matroska Player MUST play the content of the linked Segment from the ChapterTimeStart until the ChapterTimeEnd timestamp in place of the Linked Chapter.

ChapterTimeStart and ChapterTimeEnd represent timestamps in the Linked Segment matching the value of ChapterSegmentUUID. Their values MUST be in the range of the linked Segment duration.

The ChapterTimeEnd value MUST be set when using Linked-Duration chapter linking. ChapterSegmentEditionUID MUST NOT be set.
17.2.2.  **Linked Edition**

A [Matroska Player](#) **MUST** play the whole Linked Edition of the linked Segment in place of the Linked Chapter.

ChapterSegmentEditionUID represents a valid Edition from the Linked Segment matching the value of ChapterSegmentUUID.

When using Linked-Edition chapter linking, ChapterTimeEnd is **OPTIONAL**.

### 18.  **Track Flags**

#### 18.1.  **Default Flag**

The "Default Track flag" is a hint for a [Matroska Player](#) indicating that a given track **SHOULD** be eligible to be automatically selected as the default track for a given language. If no tracks in a given language have the Default Track flag set, then all tracks in that language are eligible for automatic selection. This can be used to indicate that a track provides "regular service" that is suitable for users with default settings as opposed to specialized services, such as commentary, hearing-impaired captions, or descriptive audio.

The [Matroska Player](#) **MAY** override the Default Track flag for any reason, including user preferences to prefer tracks providing accessibility services.

#### 18.2.  **Forced Flag**

The "Forced flag" tells the [Matroska Player](#) that it **SHOULD** display this subtitle track, even if user preferences usually would not call for any subtitles to be displayed alongside the audio track that is currently selected. This can be used to indicate that a track contains translations of onscreen text or dialogue spoken in a different language than the track's primary language.

#### 18.3.  **Hearing-Impaired Flag**

The "Hearing-impaired flag" tells the [Matroska Player](#) that it **SHOULD** prefer this track when selecting a default track for a hearing-impaired user and that it **MAY** prefer to select a different track when selecting a default track for a user that is not hearing-impaired.

#### 18.4.  **Visually Impaired Flag**

The "Visually Impaired flag" tells the [Matroska Player](#) that it **SHOULD** prefer this track when selecting a default track for a visually impaired user and that it **MAY** prefer to select a different track when selecting a default track for a user that is not visually impaired.
18.5. Descriptions Flag

The "Descriptions flag" tells the Matroska Player that this track is suitable to play via a text-to-speech system for a visually impaired user and that it **SHOULD NOT** automatically select this track when selecting a default track for a user that is not visually impaired.

18.6. Original Flag

The "Original flag" tells the Matroska Player that this track is in the original language and that it **SHOULD** prefer the original language if it's configured to prefer original-language tracks of this track's type.

18.7. Commentary Flag

The "Commentary flag" tells the Matroska Player that this track contains commentary on the content.

18.8. Track Operation

TrackOperation allows for the combination of multiple tracks to make a virtual one. It uses two separate system to combine tracks. One to create a 3D "composition" (left / right / background planes) and one to simplify join two tracks together to make a single track.

A track created with TrackOperation is a proper track with a UID and all its flags. However, the codec ID is meaningless because each "sub" track needs to be decoded by its own decoder before the "operation" is applied. The Cues Elements corresponding to such a virtual track **SHOULD** be the union of the Cues Elements for each of the tracks it's composed of (when the Cues are defined per track).

In the case of TrackJoinBlocks, the Block Elements (from BlockGroup and SimpleBlock) of all the tracks **SHOULD** be used as if they were defined for this new virtual Track. When two Block Elements have overlapping start or end timestamps, it's up to the underlying system to either drop some of these frames or render them the way they overlap. This situation **SHOULD** be avoided when creating such tracks, as you can never be sure of the end result on different platforms.

18.9. Overlay Track

Overlay tracks **SHOULD** be rendered in the same channel as the track it's linked to. When content is found in such a track, it **SHOULD** be played on the rendering channel instead of the original track.

18.10. Multi-planar and 3D Videos

There are two different ways to compress 3D videos: have each eye track in a separate track and have one track have both eyes combined inside (which is more efficient compression-wise). Matroska supports both ways.
For the single track variant, there is the StereoMode Element, which defines how planes are assembled in the track (mono or left-right combined). Odd values of StereoMode means the left plane comes first for more convenient reading. The pixel count of the track (PixelWidth/ PixelHeight) is the raw amount of pixels, e.g., 3840x1080 for full HD side by side and the DisplayWidth/DisplayHeight in pixels is the amount of pixels for one plane (1920x1080 for that full HD stream). Old stereo 3D were displayed using anaglyph (cyan and red colors separated). For compatibility with such movies, there is a value of the StereoMode that corresponds to AnaGlyph.

There is also a "packed" mode (values 13 and 14) that consists of packing two frames together in a Block that uses lacing. The first frame is the left eye and the other frame is the right eye (or vice versa). The frames SHOULD be decoded in that order and are possibly dependent on each other (P and B frames).

For separate tracks, Matroska needs to define exactly which track does what. TrackOperation with TrackCombinePlanes does that. For more details, see Section 18.8 to view how TrackOperation works.

The 3D support is still in infancy and may evolve to support more features.

The StereoMode used to be part of Matroska v2, but it didn't meet the requirement for multiple tracks. There was also a bug in libmatroska prior to 0.9.0 that would save/read it as 0x53B9 instead of 0x53B8; see OldStereoMode (Section 5.1.4.1.28.5). Matroska Readers MAY support these legacy files by checking Matroska v2 or 0x53B9. The older values of StereoMode were 0: mono, 1: right eye, 2: left eye, and 3: both eyes; these are the only values that can be found in OldStereoMode. They are not compatible with the StereoMode values found in Matroska v3 and above.

19. Default Track Selection

This section provides some example sets of Tracks and hypothetical user settings, along with indications of which Tracks that a similarly-configured Matroska Player SHOULD automatically select for playback by default in such a situation. A player MAY provide additional settings with more detailed controls for more nuanced scenarios. These examples are provided as guidelines to illustrate the intended usages of the various supported Track flags and their expected behaviors.

Track names are shown in English for illustrative purposes; actual files may have titles in the language of each track or provide titles in multiple languages.

19.1. Audio Selection

Example track set:

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Lang</th>
<th>Layout</th>
<th>Original</th>
<th>Default</th>
<th>Other Flags</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Video</td>
<td>und</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
The table above shows a file with 7 audio tracks, 5 of which are in English and 2 are in Spanish. The English tracks all have the Original flag indicating that English is the original content language.

Generally, the player will first consider the track languages. If the player has an option to prefer original-language audio and the user has enabled it, then it should prefer one of the tracks that have the Original flag. If configured to specifically prefer audio tracks in English or Spanish, the player should select one of the tracks in the corresponding language. The player may also wish to prefer a track with the Original flag if no tracks matching any of the user's explicitly-preferred languages are available.

Two of the tracks have the Visually Impaired flag. If the player has been configured to prefer such tracks, it should select one; otherwise, it should avoid them if possible.

If selecting an English track, when other settings have left multiple possible options, it may be useful to exclude the tracks that lack the Default flag. Here, one provides descriptive service for the visually impaired (which has its own flag and may be automatically selected by user configuration, but is unsuitable for users with default-configured players), one is a commentary track (which has its own flag and the player may or may not have specialized handling for), and the last option contains karaoke versions of the music that plays during the film (which is an unusual specialized audio service that Matroska has no built-in support for indicating, so it’s indicated in the track name instead). By not setting the Default flag on these specialized tracks, the file's author hints that they should not be automatically selected by a default-configured player.

<table>
<thead>
<tr>

<td>0</td>
<td>None</td>
<td>Karaoke</td>
</tr>
</tbody>
</table>

Table 45: Audio Tracks for Default Selection

The table above shows a file with 7 audio tracks, 5 of which are in English and 2 are in Spanish.

The English tracks all have the Original flag indicating that English is the original content language.

Generally, the player will first consider the track languages. If the player has an option to prefer original-language audio and the user has enabled it, then it should prefer one of the tracks that have the Original flag. If configured to specifically prefer audio tracks in English or Spanish, the player should select one of the tracks in the corresponding language. The player may also wish to prefer a track with the Original flag if no tracks matching any of the user's explicitly-preferred languages are available.

Two of the tracks have the Visually Impaired flag. If the player has been configured to prefer such tracks, it should select one; otherwise, it should avoid them if possible.

If selecting an English track, when other settings have left multiple possible options, it may be useful to exclude the tracks that lack the Default flag. Here, one provides descriptive service for the visually impaired (which has its own flag and may be automatically selected by user configuration, but is unsuitable for users with default-configured players), one is a commentary track (which has its own flag and the player may or may not have specialized handling for), and the last option contains karaoke versions of the music that plays during the film (which is an unusual specialized audio service that Matroska has no built-in support for indicating, so it’s indicated in the track name instead). By not setting the Default flag on these specialized tracks, the file's author hints that they should not be automatically selected by a default-configured player.
Having narrowed its choices down, the example player now may have to select between tracks 2 and 3. The only difference between these tracks is their channel layouts. 2 is 5.1 surround while 3 is stereo. If the player is aware that the output device is a pair of headphones or stereo speakers, it may wish to prefer the stereo mix automatically. On the other hand, if it knows that the device is a surround system, it may wish to prefer the surround mix.

If the player finishes analyzing all of the available audio tracks and finds that multiple seem equally and maximally preferable, it SHOULD default to the first of the group.

### 19.2. Subtitle Selection

Example track set:

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Lang</th>
<th>Original</th>
<th>Default</th>
<th>Forced</th>
<th>Other flags</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>

<td>Audio</td>
<td>fra</td>
<td>1</td>
<td>1</td>
<td>N/A</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Audio</td>
<td>por</td>
<td>0</td>
<td>1</td>
<td>N/A</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Subtitles</td>
<td>fra</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Subtitles</td>
<td>fra</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>Hearing-impaired</td>
<td>Captions for the hearing-impaired</td>
</tr>
<tr>
<td>6</td>
<td>Subtitles</td>
<td>por</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>None</td>
<td>Signs</td>
</tr>
<tr>
<td>7</td>
<td>Subtitles</td>
<td>por</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>None</td>
<td>Signs</td>
</tr>
<tr>
<td>8</td>
<td>Subtitles</td>
<td>por</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>Hearing-impaired</td>
<td>SDH</td>
</tr>
</tbody>
</table>

Table 46: Subtitle Tracks for Default Selection

The table above shows 2 audio tracks and 5 subtitle tracks. As we can see, French is the original language.

We’ll start by discussing the case where the user prefers French (or original-language) audio (or has explicitly selected the French audio track), and also prefers French subtitles.

In this case, if the player isn't configured to display captions when the audio matches their preferred subtitle languages, the player doesn't need to select a subtitle track at all.

If the user has indicated that they want captions to be displayed, the selection simply comes down to whether hearing-impaired subtitles are preferred.
The situation for a user who prefers Portuguese subtitles starts out somewhat analogous. If they select the original French audio (either by explicit audio language preference, preference for original-language tracks, or by explicitly selecting that track), then the selection once again comes down to the hearing-impaired preference.

However, the case where the Portuguese audio track is selected has an important catch: a Forced track in Portuguese is present. This may contain translations of onscreen text from the video track or of portions of the audio that are not translated (music, for instance). This means that even if the user's preferences wouldn't normally call for captions here, the Forced track should be selected nonetheless rather than selecting no track at all. On the other hand, if the user's preferences do call for captions, the non-Forced tracks should be preferred, as the Forced track will not contain captioning for the dialogue.

20. Chapters

The Matroska Chapters system can have multiple Editions and each Edition can consist of Simple Chapters where a chapter start time is used as a marker in the timeline only. An Edition can be more complex with Ordered Chapters where a chapter end time stamp is additionally used or much more complex with Linked Chapters. The Matroska Chapters system can also have a menu structure borrowed from the DVD-menu system [DVD-Video] or have its own built-in Matroska menu structure.

20.1. EditionEntry

The EditionEntry is also called an Edition. An Edition contains a set of Edition flags and MUST contain at least one ChapterAtom Element. Chapters are always inside an Edition (or a Chapter itself is part of an Edition). Multiple Editions are allowed. Some of these Editions MAY be ordered and others are not.

20.1.1. EditionFlagDefault

Only one Edition SHOULD have an EditionFlagDefault flag set to true.

20.1.2. Default Edition

The Default Edition is the Edition that a Matroska Player SHOULD use for playback by default.

The first Edition with the EditionFlagDefault flag set to true is the Default Edition.

When all EditionFlagDefault flags are set to false, then the first Edition is the Default Edition.

<table>
<thead>
<tr>
<th>Edition</th>
<th>FlagDefault</th>
<th>Default Edition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edition 1</td>
<td>true</td>
<td>X</td>
</tr>
<tr>
<td>Edition 2</td>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

Lhomme, et al. Standards Track Page 103
### 20.1.3. EditionFlagOrdered

The `EditionFlagOrdered` flag is a significant feature, as it enables an edition of Ordered Chapters that define and arrange a virtual timeline rather than simply labeling points within the timeline. For example, with editions of Ordered Chapters, a single Matroska file can present multiple edits of a film without duplicating content. Alternatively, if a videotape is digitized in full, one Ordered Edition could present the full content (including colorbars, countdown, slate, a feature presentation, and black frames) while another Edition of Ordered Chapters can use Chapters that only mark the intended presentation with the colorbars and other ancillary visual information excluded. If an Edition of Ordered Chapters is enabled, then the Matroska Player **MUST** play those Chapters in their stored order from the timestamp marked in the `ChapterTimeStart` Element to the timestamp marked in to `ChapterTimeEnd` Element.

If the `EditionFlagOrdered` flag evaluates to "0", Simple Chapters are used and only the `ChapterTimeStart` of a Chapter is used as a chapter mark to jump to the predefined point in the timeline. With Simple Chapters, a Matroska Player **MUST** ignore certain Chapter Elements. In that case, these elements are informational only.

The following list shows the different Chapter elements only found in Ordered Chapters.

- ChapterAtom/ChapterSegmentUUID
- ChapterAtom/ChapterSegmentEditionUID
- ChapterAtom/ChapterTrack

---

Lhomme, et al.  Standards Track  Page 104
Furthermore, there are other EBML Elements that could be used if the EditionFlagOrdered evaluates to "1".

**20.1.3.1. Ordered-Edition and Matroska Segment Linking**

Hard Linking: Ordered Chapters supersede the Hard Linking.

**20.2. ChapterAtom**

The ChapterAtom is also called a Chapter.

**20.2.1. ChapterTimeStart**

ChapterTimeStart is the timestamp of the start of Chapter with nanosecond accuracy and is not scaled by TimestampScale. For Simple Chapters, this is the position of the chapter markers in the timeline.

**20.2.2. ChapterTimeEnd**

ChapterTimeEnd is the timestamp of the end of Chapter with nanosecond accuracy and is not scaled by TimestampScale. The timestamp defined by the ChapterTimeEnd is not part of the Chapter. A Matroska Player calculates the duration of this Chapter by using the difference between the ChapterTimeEnd and ChapterTimeStart. The end timestamp MUST be greater than or equal to the start timestamp.

When the ChapterTimeEnd timestamp is equal to the ChapterTimeStart timestamp, the timestamps is included in the Chapter. It can be useful to put markers in a file or add chapter commands with ordered chapter commands without having to play anything; see Section 5.1.7.1.4.14.

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Start timestamp</th>
<th>End timestamp</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>0</td>
<td>1000000000</td>
<td>1000000000</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>1000000000</td>
<td>5000000000</td>
<td>4000000000</td>
</tr>
<tr>
<td>Chapter 3</td>
<td>6000000000</td>
<td>6000000000</td>
<td>0</td>
</tr>
</tbody>
</table>
20.2.3. Nested Chapters

A ChapterAtom element can contain other ChapterAtom elements. That element is a Parent Chapter and the ChapterAtom elements it contains are Nested Chapters.

Nested Chapters can be useful to tag small parts of a Segment that already has tags or add Chapter Codec commands on smaller parts of a Segment that already has Chapter Codec commands.

The ChapterTimeStart of a Nested Chapter MUST be greater than or equal to the ChapterTimeStart of its Parent Chapter.

If the Parent Chapter of a Nested Chapter has a ChapterTimeEnd, the ChapterTimeStart of that Nested Chapter MUST be smaller than or equal to the ChapterTimeEnd of the Parent Chapter.

20.2.4. Nested Chapters in Ordered Chapters

The ChapterTimeEnd of the lowest level of Nested Chapters MUST be set for Ordered Chapters.

When used with Ordered Chapters, the ChapterTimeEnd value of a Parent Chapter is useless for playback, as the proper playback sections are described in its Nested Chapters. The ChapterTimeEnd SHOULD NOT be set in Parent Chapters and MUST be ignored for playback.

20.2.5. ChapterFlagHidden

Each Chapter within a ChapterFlagHidden flag works independently of Parent Chapters. A Nested Chapter with a ChapterFlagHidden flag that evaluates to "0" remains visible in the user interface even if the Parent Chapter ChapterFlagHidden flag is set to "1".

<table>
<thead>
<tr>
<th>Chapter + Nested Chapter</th>
<th>ChapterFlagHidden</th>
<th>visible</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>0</td>
<td>yes</td>
</tr>
<tr>
<td>Nested Chapter 1.1</td>
<td>0</td>
<td>yes</td>
</tr>
<tr>
<td>Nested Chapter 1.2</td>
<td>1</td>
<td>no</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>1</td>
<td>no</td>
</tr>
<tr>
<td>Nested Chapter 2.1</td>
<td>0</td>
<td>yes</td>
</tr>
<tr>
<td>Nested Chapter 2.2</td>
<td>1</td>
<td>no</td>
</tr>
</tbody>
</table>

Table 51: ChapterFlagHidden Nested Visibility
20.3. Menu Features

The menu features are handled like a chapter codec. That means each codec has a type, some private data, and some data in the chapters.

The type of the menu system is defined by the ChapProcessCodecID parameter. For now, only two values are supported: 0 Matroska Script, 1 menu borrowed from the DVD [DVD-Video]. The private data depends on the type of menu system (stored in ChapProcessPrivate), which is the same for the data in the chapters (stored in ChapProcessData).

The menu system, as well as Chapter Codecs in general, can perform actions on the Matroska Player, such as jumping to another Chapter or Edition, selecting different tracks, and possibly more. The scope of all the possibilities of Chapter Codecs is not covered in this document, as it depends on the Chapter Codec features and its integration in a Matroska Player.

20.4. Physical Types

Each level can have different meanings for audio and video. The ORIGINAL_MEDIA_TYPE tag [MatroskaTags] can be used to specify a string for ChapterPhysicalEquiv = 60. Here is the list of possible levels for both audio and video:

<table>
<thead>
<tr>
<th>Value</th>
<th>Audio</th>
<th>Video</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>70</td>
<td>SET / PACKAGE</td>
<td>SET / PACKAGE</td>
<td>The collection of different media.</td>
</tr>
<tr>
<td>60</td>

21. Attachments

Matroska supports storage of related files and data in the Attachments Element (a Top-Level Element). Attachment Elements can be used to store related cover art, font files, transcripts, reports, error recovery files, picture or text-based annotations, copies of specifications, or other ancillary files related to the Segment.

Matroska Readers MUST NOT execute files stored as Attachment Elements.

21.1. Cover Art

This section defines a set of guidelines for the storage of cover art in Matroska files. A Matroska Reader MAY use embedded cover art to display a representational still-image depiction of the multimedia contents of the Matroska file.

Only [JPEG] and PNG [RFC2083] image formats SHOULD be used for cover art pictures.

There can be two different covers for a movie/album: a portrait style (e.g., a DVD case) and a landscape style (e.g., a wide banner ad).
There can be two versions of the same cover: the normal cover and the small cover. The dimension of the normal cover SHOULD be 600 pixels on the smallest side (e.g., 960x600 for landscape, 600x800 for portrait, or 600x600 for square). The dimension of the small cover SHOULD be 120 pixels on the smallest side (e.g., 192x120 or 120x160).

Versions of cover art can be differentiated by the filename that is stored in the FileName Element. The default filename of the normal cover in square or portrait mode is cover. (jpg|png). When stored, the normal cover SHOULD be the first Attachment in storage order. The small cover SHOULD be prefixed with "small_", such as small_cover. (jpg|png). The landscape variant SHOULD be suffixed with "_land", such as cover_land. (jpg|png). The filenames are case-sensitive.

The following table provides examples of file names for cover art in Attachments.

<table>
<thead>
<tr>
<th>FileName</th>
<th>Image Orientation</th>
<th>Pixel Length of Smallest Side</th>
</tr>
</thead>
<tbody>
<tr>
<td>cover.jpg</td>
<td>Portrait or square</td>
<td>600</td>
</tr>
<tr>
<td>small_cover.png</td>
<td>Portrait or square</td>
<td>120</td>
</tr>
<tr>
<td>cover_land.png</td>
<td>Landscape</td>
<td>600</td>
</tr>
<tr>
<td>small_cover_land.jpg</td>
<td>Landscape</td>
<td>120</td>
</tr>
</tbody>
</table>

*Table 53: Cover Art Filenames*

### 21.2. Font Files

Font files MAY be added to a Matroska file as Attachments so that the font file may be used to display an associated subtitle track. This allows the presentation of a Matroska file to be consistent in various environments where the needed fonts might not be available on the local system.

Depending on the font format in question, each font file can contain multiple font variants. Each font variant has a name that will be referred to as Font Name from now on. This Font Name can be different from the Attachment's FileName, even when disregarding the extension. In order to select a font for display, a Matroska player SHOULD consider both the Font Name and the base name of the Attachment's FileName, preferring the former when there are multiple matches.

Subtitle codecs, such as SubStation Alpha (SSA/ASS), usually refer to a font by its Font Name and instead of its filename. If none of the Attachments are a match for the Font Name, the Matroska player SHOULD attempt to find a system font whose Font Name matches the one used in the subtitle track.

Since loading fonts temporarily can take a while, a Matroska player usually loads or installs all the fonts found in attachments so they are ready to be used during playback. Failure to use the font attachment might result in incorrect rendering of the subtitles.
If a selected subtitle track has some AttachmentLink elements, the player MAY restrict its font rendering to use only these fonts.

A Matroska player SHOULD handle the official font media types from [RFC8081] when the system can handle the type:

- `font/sfnt`: Generic SFNT Font Type
- `font/ttf`: TrueType Font (TTF) Font Type
- `font/otf`: OpenType Layout (OTF) Font Type
- `font/collection`: Collection Font Type
- `font/woff`: WOFF 1.0
- `font/woff2`: WOFF 2.0

Fonts in Matroska existed long before [RFC8081]. A few unofficial media types for fonts were used in existing files. Therefore, it is RECOMMENDED for a Matroska player to support the following legacy media types for font attachments:

- `application/x-truetype-font`: TTFs equivalent to `font/ttf` and sometimes `font/otf`
- `application/x-font-ttf`: TTFs, equivalent to `font/ttf`
- `application/vnd.ms-opentype`: OTF fonts, equivalent to `font/otf`
- `application/font-sfnt`: Generic SFNT Font Type, equivalent to `font/sfnt`
- `application/font-woff`: WOFF 1.0, equivalent to `font/woff`

There may also be some font attachments with the `application/octet-stream` media type. In that case, the Matroska player MAY try to guess the font type by checking the file extension of the `AttachedFile\FileName` string. Common file extensions for fonts are:

- `.ttf` for TTFs, equivalent to `font/ttf`
- `.otf` for OTF fonts, equivalent to `font/otf` and
- `.ttc` for Collection fonts, equivalent to `font/collection`

The file extension check MUST be case-insensitive.

Matroska Writers SHOULD use a valid font media type from [RFC8081] in the `AttachedFile\FileMediaType` of the font attachment. They MAY use the media types found in older files when compatibility with older players is necessary.
22. Cues

The Cues Element provides an index of certain Cluster Elements to allow for optimized seeking to absolute timestamps within the Segment. The Cues Element contains one or many CuePoint Elements, and each MUST reference an absolute timestamp (via the CueTime Element), a Track (via the CueTrack Element), and a Segment Position (via the CueClusterPosition Element). Additional non-mandated Elements are part of the CuePoint Element, such as CueDuration, CueRelativePosition, CueCodecState, and others that provide any Matroska Reader with additional information to use in the optimization of seeking performance.

22.1. Recommendations

The following recommendations are provided to optimize Matroska performance.

- Unless Matroska is used as a live stream, it SHOULD contain a Cues Element.
- For each video track, each keyframe SHOULD be referenced by a CuePoint Element.
- It is RECOMMENDED to not reference non-keyframes of video tracks in Cues unless it references a Cluster Element that contains a CodecState Element, but no keyframes.
- For each subtitle track present, each subtitle frame SHOULD be referenced by a CuePoint Element with a CueDuration Element.
- References to audio tracks MAY be skipped in CuePoint Elements if a video track is present. When included, the CuePoint Elements SHOULD reference audio keyframes once every 500 milliseconds at most.
- If the referenced frame is not stored within the first SimpleBlock or first BlockGroup within its Cluster Element, then the CueRelativePosition Element SHOULD be written to reference where in the Cluster the reference frame is stored.
- If a CuePoint Element references a Cluster Element that includes a CodecState Element, then that CuePoint Element MUST use a CueCodecState Element.
- CuePoint Elements SHOULD be numerically sorted in storage order by the value of the CueTime Element.

23. Matroska Streaming

In Matroska, there are two kinds of streaming: file access and livestreaming.

23.1. File Access

File access can simply be reading a file located on your computer, but it also includes accessing a file from an HTTP (web) server or Common Internet File System (CIFS) (Windows share) server. These protocols are usually safe from reading errors and seeking in the stream is possible. However, when a file is stored far away or on a slow server, seeking can be an expensive operation and should be avoided. The guidelines in Section 25, when followed, help reduce the
number of seeking operations for regular playback and also have the playback start quickly without a lot of data needed to read first (such as a Cues Element, Attachment Element, or SeekHead Element).

Matroska, having a small overhead, is well suited for storing music/videos on file servers without a big impact on the bandwidth used. Matroska does not require the index to be loaded before playing, which allows playback to start very quickly. The index can be loaded only when seeking is requested the first time.

### 23.2. Livestreaming

Livestreaming is the equivalent of television broadcasting on the Internet. There are two families of servers for livestreaming: RTP / Real-Time Streaming Protocol (RTSP) and HTTP. Matroska is not meant to be used over RTP. RTP already has timing and channel mechanisms that would be wasted if doubled in Matroska. Additionally, having the same information at the RTP and Matroska level would be a source of confusion if they do not match. Livestreaming of Matroska over file-like protocols like HTTP, QUIC, etc., is possible.

A live Matroska stream is different from a file because it usually has no known end (only ending when the client disconnects). For this, all bits of the "size" portion of the Segment Element **MUST** be set to 1. Another option is to concatenate Segment Elements with known sizes one after the other. This solution allows a change of codec/resolution between each Segment. For example, this allows for a switch between 4:3 and 16:9 in a television program.

When Segment Elements are continuous, certain Elements like SeekHead, Cues, Chapters, and Attachments **MUST NOT** be used.

It is possible for a Matroska Player to detect that a stream is not seekable. If the stream has neither a SeekHead list nor a Cues list at the beginning of the stream, it **SHOULD** be considered non-seeable. Even though it is possible to seek forward in the stream, it is **NOT RECOMMENDED**.

In the context of live radio or web TV, it is possible to “tag” the content while it is playing. The Tags Element can be placed between Clusters each time it is necessary. In that case, the new Tags Element **MUST** reset the previously encountered Tags Elements and use the new values instead.

### 24. Tags

#### 24.1. Tags Precedence

Tags allow tagging all kinds of Matroska parts with very detailed metadata in multiple languages.

Some Matroska elements also contain their own string value, such as the Track Name (Section 5.1.4.1.18) or the Chapter String (Section 5.1.7.1.4.10).
The following Matroska elements can also be defined with tags:

- The Track Name Element (Section 5.1.4.1.18) corresponds to a tag with the TagTrackUID (Section 5.1.8.1.1.3) set to the given track, a TagName of TITLE (Section 5.1.8.1.2.1), and a TagLanguage (Section 5.1.8.1.2.2) or TagLanguageBCP47 (Section 5.1.8.1.2.3) of "und".

- The Chapter String Element (Section 5.1.7.1.4.10) corresponds to a tag with the TagChapterUID (Section 5.1.8.1.1.5) set to the same chapter UID, a TagName of TITLE (Section 5.1.8.1.2.1), and a TagLanguage (Section 5.1.8.1.2.2) or TagLanguageBCP47 (Section 5.1.8.1.2.3) matching the ChapLanguage (Section 5.1.7.1.4.11) or ChapLanguageBCP47 (Section 5.1.7.1.4.12), respectively.

- The FileDescription Element (Section 5.1.6.1.1) of an attachment corresponds to a tag with the TagAttachmentUID (Section 5.1.8.1.1.6) set to the given attachment, a TagName of TITLE (Section 5.1.8.1.2.1), and a TagLanguage (Section 5.1.8.1.2.2) or TagLanguageBCP47 (Section 5.1.8.1.2.3) of "und".

When both values exist in the file, the value found in Tags takes precedence over the value found in original location of the element. For example, if you have a TrackEntry\Name element and Tag TITLE for that track in a Matroska Segment, the Tag string SHOULD be used instead of the TrackEntry\Name string to identify the track.

As the Tag element is optional, a lot of Matroska Readers do not handle it and will not use the tags value when it's found. For maximum compatibility, it's usually better to put the strings in the TrackEntry, ChapterAtom, and Attachment and keep the tags matching these values if tags are also used.

### 24.2. Tag Levels

Tag elements allow tagging information on multiple levels; each level has a **TargetTypeValue** (Section 5.1.8.1.1.1). An element for a given TargetTypeValue also applies to the lower levels denoted by smaller TargetTypeValue values. If an upper value doesn't apply to a level, but the actual value to use is not known, an empty TagString element (Section 5.1.8.1.2.5) or an empty TagBinary element (Section 5.1.8.1.2.6) MUST be used as the tag value for this level.

See [MatroskaTags] for more details on common tag names, types, and descriptions.

### 25. Implementation Recommendations

#### 25.1. Cluster

It is RECOMMENDED that each individual Cluster Element contains no more than five seconds or five megabytes of content.

#### 25.2. SeekHead

It is RECOMMENDED that the first SeekHead Element be followed by a Void Element to allow for the SeekHead Element to be expanded to cover new Top-Level Elements that could be added to the Matroska file, such as Tags, Chapters, and Attachments Elements.
The size of this Void Element should be adjusted depending on the Matroska file that already has Tags, Chapters, and Attachments Elements.

### 25.3. Optimum Layouts

While there can be Top-Level Elements in any order, some ordering of Elements are better than others. The following sections detail a few optimum layouts for different use cases.

#### 25.3.1. Optimum Layout for a Muxer

This is the basic layout muxers should be using for an efficient playback experience:

- SeekHead
- Info
- Tracks
- Chapters
- Attachments
- Tags
- Clusters
- Cues

#### 25.3.2. Optimum Layout after Editing Tags

When tags from the previous layout need to be extended, they are moved to the end with the extra information. The location where the old tags were located is voided.

- SeekHead
- Info
- Tracks
- Chapters
- Attachments
- Void
- Clusters
- Cues
- Tags

#### 25.3.3. Optimum Layout with Cues at the Front

Cues are usually a big chunk of data referencing a lot of locations in the file. Players that want to seek in the file need to seek to the end of the file to access these locations. It is often better if they are placed early in the file. On the other hand, that means players that don't intend to seek will have to read/skip this data no matter what.
Because the Cues reference locations further in the file, it's often complicated to allocate the proper space for that element before all the locations are known. Therefore, this layout is rarely used:

- SeekHead
- Info
- Tracks
- Chapters
- Attachments
- Tags
- Cues
- Clusters

### 25.3.4. Optimum Layout for Livestreaming

In Livestreaming (Section 23.2), only a few elements make sense. For example, SeekHead and Cues are useless. All elements other than the Clusters MUST be placed before the Clusters.

- Info
- Tracks
- Attachments (rare)
- Tags
- Clusters

### 26. Security Considerations

Matroska inherits security considerations from EBML.

Attacks on a Matroska Reader could include:

- Storage of an arbitrary and potentially executable data within an Attachment Element. Matroska Readers that extract or use data from Matroska Attachments SHOULD check that the data adheres to expectations or not use the attachment.
- A Matroska Attachment with an inaccurate media type.
- Damage to the Encryption and Compression fields (Section 14) that would result in bogus binary data interpreted by the decoder.
- Chapter Codecs running unwanted commands on the host system.

The same error handling done for EBML applies to Matroska files. Particular error handling is not covered in this specification, as this is depends on the goal of the Matroska Readers. It is up to the decision of the Matroska Readers on how to handle the errors if they are recoverable in their code or not. For example, if the checksum of the Segment Tracks is invalid, some could decide to try to read the data anyway, some will just reject the file, and most will not even check it.
Matroska Reader implementations need to be robust against malicious payloads; those that are related to denial of service are outlined in Section 2.1 of [RFC4732].

Although rarer, the same may apply to a Matroska Writer. Malicious stream data must not cause the Matroska Writer to misbehave, as this might allow an attacker access to transcoding gateways.

As an audio and visual container format, a Matroska file or stream will potentially encapsulate numerous byte streams created with a variety of codecs. Implementers will need to consider the security considerations of these encapsulated formats.

27. IANA Considerations

27.1. Matroska Element IDs Registry

This document creates a new IANA registry called the "Matroska Element IDs" registry.

To register a new Element ID in this registry, one needs an Element ID, a Change Controller (IETF or email of registrant), and an optional reference to a document describing the Element ID.

Element IDs are encoded using the VINT mechanism described in Section 4 of [RFC8794] and can be between one and five octets long. Five-octet-long Element IDs are possible only if they are declared in the EBML header.

Element IDs are described in Section 5 of [RFC8794] with [Err7189] and [Err7191].

One-octet Matroska Element IDs are to be allocated according to the "RFC Required" policy [RFC8126].

Two-octet Matroska Element IDs are to be allocated according to the "Specification Required" policy [RFC8126].

Three-octet and four-octet Matroska Element IDs are to be allocated according to the "First Come First Served" policy [RFC8126].

The allowed values in the Matroska Element IDs registry are similar to the ones found in the EBML Element IDs registry defined in Section 17.1 of [RFC8794].

EBML IDs defined for the EBML Header, as defined in Section 17.1 of [RFC8794], MUST NOT be used as Matroska Element IDs.

Given the scarcity of the one-octet Element IDs, they should only be created to save space for elements found many times in a file. For example, within a BlockGroup or Chapters. The four-octet Element IDs are mostly for synchronization of large elements. They should only be used for such high level elements. Elements that are not expected to be used often should use three-octet Element IDs.
Elements found in Appendix A have an assigned Matroska Element ID for historical reasons. These elements are not in use and **SHOULD NOT** be reused unless there is no other IDs available with the desired size. Such IDs are considered as reclaimed to the IANA registry, as they could be used for other things in the future.

Values of Matroska Element IDs found in this document are assigned as initial values as follows:

<table>
<thead>

</table>
This document creates a new IANA registry called the "Matroska Chapter Codec IDs" registry. The values correspond to the unsigned integer ChapProcessCodecID value described in Section 5.1.7.1.4.15.

To register a new Chapter Codec ID in this registry, one needs a Chapter Codec ID, a Change Controller (IETF or email of registrant), and an optional reference to a document describing the Chapter Codec ID.

The Chapter Codec IDs are to be allocated according to the "First Come First Served" policy [RFC8126].

ChapProcessCodecID values of "0" and "1" are RESERVED to the IETF for future use.

### 27.3. Media Types

Matroska files and streams are found in three main forms: audio-video files, audio-only, and occasionally with stereoscopic video tracks.
Historically, Matroska files and streams have used the following media types with an "x-" prefix. For better compatibility, a system SHOULD be able to handle both formats. Newer systems SHOULD NOT use the historic format and use the format that follows the [RFC6838] format instead.

Please register three media types, the [RFC6838] templates are below:

### 27.3.1. For Files Containing Video Tracks

**Type name:** video

**Subtype name:** matroska

**Required parameters:** N/A

**Optional parameters:** N/A

**Encoding considerations:** as per this document and RFC8794

**Security considerations:** See Section 26.

**Interoperability considerations:** Due to the extensibility of Matroska, it is possible to encounter files with unknown but valid EBML Elements. Readers should be ready to handle this case. The fixed byte order, octet boundaries, and UTF-8 usage allow for broad interoperability.

**Published specification:** THISRFC

**Applications that use this media type:** FFmpeg, VLC, ...

**Fragment identifier considerations:** N/A

**Additional information:**
- Deprecated alias names for this type: video/x-matroska
- Magic number(s): N/A
- File extension(s): mkv
- Macintosh file type code(s): N/A

**Person & email address to contact for further information:** IETF CELLAR WG cellar@ietf.org

**Intended usage:** COMMON

**Restrictions on usage:** None

**Author:** IETF CELLAR WG

**Change controller:** IETF

### 27.3.2. For Files Containing Audio Tracks with No Video Tracks

**Type name:** audio

**Subtype name:** matroska
Required parameters: N/A
Optional parameters: N/A
Encoding considerations: as per this document and RFC8794
Interoperability considerations: Due to the extensibility of Matroska, it is possible to encounter files with unknown but valid EBML Elements. Readers should be ready to handle this case. The fixed byte order, octet boundaries, and UTF-8 usage allow for broad interoperability.

Published specification: THISRFC
Applications that use this media type: FFmpeg, VLC, ...
Fragment identifier considerations: N/A
Additional information:
  Deprecated alias names for this type: audio/x-matroska
  Magic number(s): N/A
  File extension(s): mka
  Macintosh file type code(s): N/A

Person & email address to contact for further information: IETF CELLAR WG cellar@ietf.org
Intended usage: COMMON
Restrictions on usage: None
Author: IETF CELLAR WG
Change controller: IETF

27.3.3. For Files Containing a Stereoscopic Video Track

Type name: video
Subtype name: matroska-3d
Required parameters: N/A
Optional parameters: N/A
Encoding considerations: as per this document and RFC8794
Interoperability considerations: Due to the extensibility of Matroska, it is possible to encounter files with unknown but valid EBML Elements. Readers should be ready to handle this case. The fixed byte order, octet boundaries, and UTF-8 usage allow for broad interoperability.
28. References

28.1. Normative References

Published specification:  THISRFC

Applications that use this media type:  FFmpeg, VLC, ...

Fragment identifier considerations:  N/A

Additional information:

Deprecated alias names for this type:  video/x-matroska-3d
Magic number(s):  N/A
File extension(s):  mk3d
Macintosh file type code(s):  N/A

Person & email address to contact for further information:  IETF CELLAR WG cellar@ietf.org

Intended usage:  COMMON

Restrictions on usage:  None

Author:  IETF CELLAR WG

Change controller:  IETF
28.2. Informative References

Appendix A. Historic Deprecated Elements

Since Matroska has evolved since 2002, many parts that were considered for use in the format were never used and often incorrectly designed. Many of the elements that were defined then are not found in any known files, but were part of public specs. DivX also had a few custom elements that were designed for custom features.

We list these elements that have a known ID that SHOULD NOT be reused to avoid colliding with existing files. They might be reassigned by IANA in the future if there are no more IDs for a given size. A short description of what each ID was used for is included, but the text is not normative.

A.1. SilentTracks Element
The list of tracks that are not used in that part of the stream. It is useful when using overlay tracks on seeking or deciding what track to use.

A.2. SilentTrackNumber Element

type / id: uinteger / 0x58D7
path: \Segment\Cluster\SilentTracks\SilentTrackNumber
documentation: One of the track numbers that are not used from now on in the stream. It could change later if it is not specified as silent in a further Cluster.

A.3. BlockVirtual Element

type / id: binary / 0xA2
path: \Segment\Cluster\BlockGroup\BlockVirtual
documentation: A Block with no data. It must be stored in the stream at the place that the real Block would be in display order.

A.4. ReferenceVirtual Element

type / id: integer / 0xFD
path: \Segment\Cluster\BlockGroup\ReferenceVirtual
documentation: The Segment Position of the data that would otherwise be in position of the virtual block.

A.5. Slices Element

type / id: master / 0x8E
path: \Segment\Cluster\BlockGroup\Slices
documentation: Contains slices description.

A.6. TimeSlice Element

type / id: master / 0xE8
path: \Segment\Cluster\BlockGroup\Slices\TimeSlice
documentation: Contains extra time information about the data contained in the Block. Being able to interpret this Element is not required for playback.

A.7. LaceNumber Element

type / id: uinteger / 0xCC
path: \Segment\Cluster\BlockGroup\Slices\TimeSlice\LaceNumber
A.8. FrameNumber Element

type / id: uinteger / 0xCD
path: \Segment\Cluster\BlockGroup\Slices\TimeSlice\FrameNumber
documentation: The number of the frame to generate from this lace with this delay (allows for the generation of many frames from the same Block/Frame).

A.9. BlockAdditionID Element

type / id: uinteger / 0xCB
path: \Segment\Cluster\BlockGroup\Slices\TimeSlice\BlockAdditionID
documentation: The ID of the BlockAdditional Element (0 is the main Block).

A.10. Delay Element

type / id: uinteger / 0xCE
path: \Segment\Cluster\BlockGroup\Slices\TimeSlice\Delay
documentation: The delay to apply to the Element expressed in Track Ticks; see Section 11.1.

A.11. SliceDuration Element

type / id: uinteger / 0xCF
path: \Segment\Cluster\BlockGroup\Slices\TimeSlice\SliceDuration
documentation: The duration to apply to the Element expressed in Track Ticks; see Section 11.1.

A.12. ReferenceFrame Element

type / id: master / 0xC8
path: \Segment\Cluster\BlockGroup\ReferenceFrame
documentation: Contains information about the last reference frame. See [DivXTrickTrack].

A.13. ReferenceOffset Element

type / id: uinteger / 0xC9
path: \Segment\Cluster\BlockGroup\ReferenceFrame\ReferenceOffset
documentation: The relative offset, in bytes, from the previous BlockGroup element for this Smooth FF/RW video track to the containing BlockGroup element. See [DivXTrickTrack].

A.14. ReferenceTimestamp Element
The timestamp of the BlockGroup pointed to by ReferenceOffset expressed in Track Ticks; see Section 11.1. See [DivXTrickTrack].

A.15. EncryptedBlock Element

Similar to SimpleBlock (see Section 10.2), but the data inside the Block is Transformed (encrypt and/or signed).

A.16. MinCache Element

The minimum number of frames a player should be able to cache during playback. If set to 0, the reference pseudo-cache system is not used.

A.17. MaxCache Element

The maximum cache size necessary to store referenced frames in and the current frame. 0 means no cache is needed.

A.18. TrackOffset Element

A value to add to the Block's Timestamp expressed in Matroska Ticks -- i.e., in nanoseconds; see Section 11.1. This can be used to adjust the playback offset of a track.

A.19. CodecSettings Element

A string describing the encoding setting used.

A.20. CodecInfoURL Element

A string describing the encoding setting used.
A URL to find information about the codec used.

### A.21. CodecDownloadURL Element

- **type/id:** string / 0x26B240
- **path:** \Segment\Tracks\TrackEntry\CodecDownloadURL
- **documentation:** A URL to download about the codec used.

### A.22. CodecDecodeAll Element

- **type/id:** uinteger / 0xAA
- **path:** \Segment\Tracks\TrackEntry\CodecDecodeAll
- **documentation:** Set to 1 if the codec can decode potentially damaged data.

### A.23. TrackOverlay Element

- **type/id:** uinteger / 0x6FAB
- **path:** \Segment\Tracks\TrackEntry\TrackOverlay
- **documentation:** Specify that this track is an overlay track for the Track specified (in the uinteger). That means when this track has a gap on SilentTracks, the overlay track should be used instead. The order of multiple TrackOverlay matters; the first one is the one that should be used. If the first one is not found, it should be the second, etc.

### A.24. AspectRatioType Element

- **type/id:** uinteger / 0x54B3
- **path:** \Segment\Tracks\TrackEntry\Video\AspectRatioType
- **documentation:** Specify the possible modifications to the aspect ratio.

### A.25. GammaValue Element

- **type/id:** float / 0x2FB523
- **path:** \Segment\Tracks\TrackEntry\Video\GammaValue
- **documentation:** Gamma Value.

### A.26. FrameRate Element

- **type/id:** float / 0x2383E3
- **path:** \Segment\Tracks\TrackEntry\Video\FrameRate
- **documentation:** Number of frames per second. This value is Informational only. It is intended for constant frame rate streams and should not be used for a variable frame rate TrackEntry.
A.27. ChannelPositions Element

type / id: binary / 0x7D7B
path: \Segment\Tracks\TrackEntry\Audio\ChannelPositions
documentation: Table of horizontal angles for each successive channel.

A.28. TrickTrackUID Element

type / id: uinteger / 0xC0
path: \Segment\Tracks\TrackEntry\TrickTrackUID
documentation: The TrackUID of the Smooth FF/RW video in the paired EBML structure corresponding to this video track. See [DivXTrickTrack].

A.29. TrickTrackSegmentUID Element

type / id: binary / 0xC1
path: \Segment\Tracks\TrackEntry\TrickTrackSegmentUID
documentation: The SegmentUID of the Segment containing the track identified by TrickTrackUID. See [DivXTrickTrack].

A.30. TrickTrackFlag Element

type / id: uinteger / 0xC6
path: \Segment\Tracks\TrackEntry\TrickTrackFlag
documentation: Set to 1 if this video track is a Smooth FF/RW track. If set to 1, MasterTrackUID and MasterTrackSegmentUID should be present and BlockGroups for this track must contain ReferenceFrame structures. Otherwise, TrickTrackUID and TrickTrackSegmentUID must be present if this track has a corresponding Smooth FF/RW track. See [DivXTrickTrack].

A.31. TrickMasterTrackUID Element

type / id: uinteger / 0xC7
path: \Segment\Tracks\TrackEntry\TrickMasterTrackUID
documentation: The TrackUID of the video track in the paired EBML structure that corresponds to this Smooth FF/RW track. See [DivXTrickTrack].

A.32. TrickMasterTrackSegmentUID Element

type / id: binary / 0xC4
path: \Segment\Tracks\TrackEntry\TrickMasterTrackSegmentUID
documentation: The SegmentUID of the Segment containing the track identified by MasterTrackUID. See [DivXTrickTrack].
A.33. ContentSignature Element

type/id: binary/0x47E3
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentSignature
documentation: A cryptographic signature of the contents.

A.34. ContentSigKeyID Element

type/id: binary/0x47E4
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentSigKeyID
documentation: This is the ID of the private key that the data was signed with.

A.35. ContentSigAlgo Element

type/id: uinteger/0x47E5
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentSigAlgo
documentation: The algorithm used for the signature.

A.36. ContentSigHashAlgo Element

type/id: uinteger/0x47E6
path: \Segment\Tracks\TrackEntry\ContentEncodings\ContentEncoding\ContentEncryption\ContentSigHashAlgo
documentation: The hash algorithm used for the signature.

A.37. CueRefCluster Element

type/id: uinteger/0x97
path: \Segment\Cues\CuePoint\CueTrackPositions\CueReference\CueRefCluster
documentation: The Segment Position of the Cluster containing the referenced Block.

A.38. CueRefNumber Element

type/id: uinteger/0x535F
path: \Segment\Cues\CuePoint\CueTrackPositions\CueReference\CueRefNumber
documentation: Number of the referenced Block of Track X in the specified Cluster.

**A.39. CueRefCodecState Element**

type / id: uinteger / 0xEB
path: \Segment\Cues\CuePoint\CueTrackPositions\CueReference\CueRefCodecState
documentation: The Segment Position of the Codec State corresponding to this referenced Element. 0 means that the data is taken from the initial Track Entry.

**A.40. FileReferral Element**

type / id: binary / 0x4675
path: \Segment\Attachments\AttachedFile\FileReferral
documentation: A binary value that a track/codec can refer to when the attachment is needed.

**A.41. FileUsedStartTime Element**

type / id: uinteger / 0x4661
path: \Segment\Attachments\AttachedFile\FileUsedStartTime
documentation: The timestamp at which this optimized font attachment comes into context and is expressed in Segment Ticks, which are based on TimestampScale. See [DivXWorldFonts].

**A.42. FileUsedEndTime Element**

type / id: uinteger / 0x4662
path: \Segment\Attachments\AttachedFile\FileUsedEndTime
documentation: The timestamp at which this optimized font attachment goes out of context and is expressed in Segment Ticks, which are based on TimestampScale. See [DivXWorldFonts].

**A.43. TagDefaultBogus Element**

type / id: uinteger / 0x44B4
path: \Segment\Tags\Tag\+SimpleTag\TagDefaultBogus
documentation: A variant of the TagDefault element with a bogus Element ID. See Section 5.1.8.1.2.4.
